Novel secreted and transmembrane polypeptides and polynucleotides encoding them useful for treating abnormal bleeding involved in gynecological diseases, skin diseases and neurodegenerative diseases.

Example 37; Page 107; 478pp; English.

The invention relates to an isolated PRO polypeptide. PRO317 is useful in diagnosing or treating abnormal bleeding involved in gynecological diseases e.g. to avoid or lessen the need for hysterectomy. PRO317 may also be useful as an agent that affects angiogenesis and PRO317 is useful in anti-tumour indications or in treating coronary ischeamic conditions. PRO311 and PRO217 polypeptides are useful for treating disorders associated with the preservation and maintenance of gastrointestinal mucosa and the repair of acute and chronic mucosal lesions, skin diseases associated with abnormal keratinocyte differentiation (e.g. psoriasis). PRO387 polypeptide is useful for treating Parkinson's disease, Alzheimer's disease, amyotrophic lateral sclerosis (ALS), neuropathies

                                                                                                                                                                                                                                                                                                                                                              24 - NOV -
       and disease related to uncontrolled cell growth, e.g. cancer. PR0219

CC polypeptide plays a regulatory role in the blood coagulation cascade.

PR0246 polypeptides which serves as tumour specific antigens may be exploited as therapeutic targets for anti-tumour drugs. PR0269 exploited as therapeutic targets for anti-tumour drugs. PR0266 polypeptide is useful as an antithrombotic agent with reduced risk for haemorrhage as compared with heparin. PR0317 polypeptide is useful in creating endomerial bleeding angiogenesis. PR0287 polypeptides and polypeptides and polypeptides and polypeptides and tissue repair. PR0214 polypeptides are useful for treating asthma, rheumatoid arthritis, psoriasis and multiple sclerosis. The polypeptide and tissue repair. CC are useful for tissue typing. PRO antibodies are useful for cassay of sample fluids. Anti-PRO antibodies are useful in diagnostic assays for PRO e.g. detecting its cypuspide are useful in diagnostic assays for PRO e.g. detecting its cypuspide cells, tissues or serum and for affinity present sequence represents a human secreted/transmembrane PRO cyc polypeptide PCR primer
                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; PCR; primer; ss; PRO; secreted; transmembrane; pharmaceutical; diagnostic; biosensor; bioreactor; therapeutic; hyperplassia; endometriosis; cancer; tumour; ischaemia; coronary arterial disease; polycytic kidney disease; temal failure; inflammatory response; asthma; rheumatoid arthritis; psoriasis; multiple sclerosis; gene therapy; cytostatic; gynecological; cardiant; nephrotropic; hepatotropic; antiinflammatory.

        The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bloactive molecule to a cell expressing a PRO protein and for modulating at least one biological activity of a cell. The PRO polypeptides or polymucleotides are also useful as pharmaceuticals, diagnostics, biosensors or bioreactors, for detecting or treating e.g. hyperplasia, endometriosis, cancers (e.g. those involving solid tumours), ischaemia, coronary arterial disease, polyyostic kidney disease, chronic or acute renal failure, or inflammatory responses (e.g. asthma, rheumatoid arthritis, psoriasis or multiple sclerosis) in mammals. The PRO genes may gene. The sequences presented in ABX96017-ABX96378 are the genes encoding, the primers amplifying and the probes detecting the PRO polynucleotides of the invention
                                                                                                                                                                                                                                                                                                                                                                          ö
and genes encoding them, useful for detecting or treating e.g.
hyperplasia, endometriosis, cancers, ischemia, coronary arterial disease
or inflammations.

 The invention relates to sixty one nucleic acids encoding PRO

CD polypeptides (secreted and transmembrane). The polynucleotide is useful

CC in molecular biology, including uses as hybridisation probes, in

CC chromosome and gene mapping, in generating antisense RNA and DNA, and in

CC gene therspy. The polynucleotide may also be used in preparing PRO

CC gene therspy. The polynucleotide may also be used in preparing PRO

CC polypeptides by recombinant techniques, and in generating either

CC transgenic animals or knock-out animals which, in turn, are useful in the

CC polypeptide or the antibody is used in preparing a medicament for

CC polypeptide or the antibody is used in preparing a medicament for

CC polypeptide or the antibody is used in preparing a medicament for

CC treating a condition responsive to the polypeptide or antibody, such as

mucosal lesions e.g. ulcers and enterocolitis, skin disease e.g.

C psoriasis, cancer e.g. lung cancer and colon cancer, nerve cell disease

CC atrophia areata, adisease and Parkinson's disease, Usher syndrome,

CT atrophia areata, andiogenesis, inflammatory disease e.g asthma and

C rheumatoid arthritis, ischaemia, and in various diagnostic assays. The

CC polypeptide

Novel secreted and transmembrane polypeptide for modulating biological activity of cell expressing the polypeptide, identifying agonists or antagonists of polypeptide, and as molecular weight markers.

Example 37; Page 106; 469pp; English.

The invention relates to an isolated, secreted and transmembrane polypeptide, termed PRO polypeptide. The polypeptide, for preparing variants of the polypeptide, so metagonists of the polypeptide is useful for preparing variants of the polypeptide. The polypeptide is also useful for preparing variants of the polypeptide is also useful as therapeutic electrophoreals purpose and the nucleic acid is useful for recombinantly expensing those markers. The polypeptide is also useful as therapeutic agent. PRO is useful in assays to identify other proteins or molecules involved in binding interaction. The nucleic acid is useful as therapeutic probes, in chromosome and gene mapping, in generation of antistense RNA and DNA, in the preparation of PRO pypeptide, for generating transgenic animals or knockout animals which in turn are construct hybridisation probes for mapping, in generation construct hybridisation probes for mapping with genetic asceders, in gene therapy, for chromosome identification, as chromosome marker, and for generating probes for polymerase chain reaction (PCR), overthern analysis of individuals which encodes the PRO and for the genetic analysis. PRO antibody is useful in diagnostic assays for PRO, e.g. detecting its expression in specific cells, tissues or serum and for affinity purification of PRO from the preparation of medicament for treating conditions which is responsive to the PRO polypeptide or anti-PRO antibody eig tumour. The polypeptide and the nucleic acid is useful for the preparation of medicament typing. The polypeptide is useful for treating bone and/or cartilage or inhibiting tumour growth, enhances vascular permeability and immune treating hearing loss in mammals and for treating bone and/or cartilage creating hearing loss in mammals and entrating properior creating properior and arthiting the present engances. disorders such as sports injuries and arthritis. The present sequence represents a human secreted and transmembrane PRO polypeptide PCR primer

Glucksmann MA; WPI; 2003-298709/29. Goodearl ADJ,

New muscarinic acetylcholine receptor 6 (mACHR-6) nucleic acids and proteins, useful for modulating acetylcholine or phosphatidylinositol, particularly for treating e.g. schizophrenia, chest pain, tachycardia or arrhythmia.

Disclosure; Page 26; 66pp; English.

The invention relates to an isolated human or rat muscarinic acetylcholine receptor 6 (mACHR-6) nucleic acid molecule and the encoded protein. Also included are (non-human) host cells comprising the mACHR-6 nucleic acid molecule, an antibody that selectively bind the polypeptide above, a method for producing the polypeptide by culturing the host cell above, a method for buckler acid is expressed, a method for detecting the presence of the mACHR-6 polypeptide and nucleic acid, a method for detecting a compound that binds to the mACHR-6 polypeptide and a method for identifying a compound that binds to the mACHR-6 polypeptide and a method for identifying a compound that binds to the mACHR-6 polypeptide and a method for identifying a compound that binds to the mACHR-6 polypeptide. The mACHR-6 polypeptide and a method of compounding assays, diagnostic assays for identifying diseases, allelic planmacogenetic testing, methods of treatment, pharmacogenetic testing, methods of treatment, pharmacogenetic testing, methods of treatment, pharmacogenetic testing, polypeptide or antibody is useful carticular, the mACHR-6 polymuclectide, polypeptide or antibody is useful for treating or diagnosing cognitive disorders (e.g. ammessic, amnessic or treatment alsorientation, Kluver-Bucy syndrome, Alzheimer's related memory loss or learning disability), disorders (e.g. pain related to irritable bowel syndrome, or chest pain), movement disorders (e.g. enlisophers) and related disorders (e.g. parkinson's disease), eating disorders (e.g. insulin hypersecretion obesity), heart muscle related disorders (e.g. bradycardia, tarthythmia, flutter or fibrillation), or gland related disorder (e.g. arrhythmia, flutter or fibrillation), or gland related disorder (e.g. arrhythmia, elutter or fibrillation), or gland related disorder (e.g. arrhythmia, flutter or fibrillation), or gland related disorder (e.g. arrhythmia, flutter or fibrillation), plant related disorder (e.g. arrhythmia, arrhythmia, flutter or fibrillation).

```
New PRO polypeptides and nucleic acid molecules, useful in diagnosing or treating inflammatory diseases, organ failure, atherosclerosis, cardiac injury, infertility, cancer, AIDS, Alzheimer's disease or Parkinson's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         WPI; 2003-341586/32.

The invention describes sixty one nucleic acids encoding PRO polypeptides (secreted and transmembrane). The PRO polypeptides and nucleic acids are useful in diagnosing or treating enterocolities, gastrointestinal ulceration, skin disease associated with abnormal keratinocyte differentiation, e.g. psoriasis or epithelial cancers such as squamous cell carcinoma, Alzheimer's disease, Parkinson's disease, amyotrophic lateral sclerosis, inflammatory diseases, e.g. rheumatoid arthritis, asthma or multiple sclerosis, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, cancer, canburt, infertility, birth defects, premature aging, AIDS, cancer, disbetic complications, or mutations in general. The polypeptides are also useful for wound repair and associated therapies concerned with respect to useful in gene therapy, and as molecular weight markers for protein electrophoresis purposes. The anti-PRO antibodies may be used in diagnostic assays for PRO, or for the affinity purification of PRO from tecombinant cell culture or natural sources. This sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         polymorphic site; nootropic; neuroprotective; anticonvulsant; anorectic; hypotensive; cardiant; thrombolytic; antiarteriosclerotic; osteopathic; antirheumatic; antiarthritic; antianflammatory; antinnfertility; psychiatric disorder; bipolar affective disorder; unipolar depression; gchizophrenia; anxiety; neurological disorder; obesity; insomnia; addiction; neurodegeneration; hypotension; hypertension; acute heart failure; atherothembosis; atherosclerosis; osteoporosis; rheumatoid arthritis; infertility; single nucleotide polymorphism; SNP;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New polynucleotides encoding GPRSO receptor proteins and having at least one polymorphic site, useful for screening for GPRSO modulators for treating psychiatric disorders, e.g. bipolar affective disorder or unipolar depression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; G protein-coupled receptor; receptor; GPR50; allelic variant;

The present invention describes a polynucleotide sequence (I) which encodes a G protein-coupled receptor designated GPR50 and has at least encodes a G protein-coupled receptor designated GPR50 and has at least come polymorphic site. Also described are GPR50 allait variant polynucleotide sequences (ABZ81152 to ABZ81158) which encode the proteins given in ABR39074 to ABR39080. (I) has nootropic, neuroprotective, anticonvulsant, anorectic, properties, antiarthritic, antiarthritic, antiarteriosclerotic, osteopathic, antirheumatic, antiarthritic, antiarteriors and expression vectors from the present invention can be used in screening assays for identifying new drugs, and screening for USR50 modulators for preparing a medicament for treating psychiatric GRR50 modulators for preparing a medicament for treating psychiatric disorders, e.g. bipolar affective disorder or unipolar depression. They care also useful for correcting, preventing or ameliocating depression, schizophrenia, anxiety, neurological disorder, obseity, insomnia, addiction, neurodegeneration, hypotension, hypertension, acute heart atherothromboasis, atherosclerosis, osteoporosis, rheumatoid arthritis and infertility. The present sequence represents a PCR primer used to amplify the single nucleotide polymorphism (SNP) 1804 of human GPR50, which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; 88; PCR; primer; gene therapy; apoptosis; bleeding; tumour; ALS; gynacclogical disease; hysterectomy; angiogenesis; skin disease; cancer; coronary ischaemic condition; gastrointestinal mucosa disorder; asthma; mucosal lesion repair; keratinocyte differentiation; psoriasis; Parkinson's disease; Alzheimer's disease; amyotrophic lateral sclerosis; neuropathy; blood coagulation cascade disorder; thrombosis; hemorrhage; neurodegenerative disease; endometrial bleeding; wound healing; tissue repair; rheumatoid arthritis; multiple sclerosis; tissue typing.

```
The invention relates to an isolated secreted and transmembrane PRO CC polypeptide. The PRO polypeptides are useful for modulating biological activity of a cell, in diagnoseing or treating abnormal bleeding involved in gynaecological diseases e.g. to avoid or lessen the need for hysterectomy, for treating angiogenesis, tumour, coronary ischaemic condition, disorders associated with the preservation and maintenance of gastrointestinal mucosa and the repair of acute and chronic mucosal lesions, skin diseases associated with abnormal keratinocyte (differentiation) (e.g. psoriasis), Parkinson's disease, Alzheimer's disease, amyotrophic lateral sclerosis (ALS), neuropathies, disease condensing disorders, neurodegenerative disease, thrombosis, haemorrhage, endometrial bleeding, wound healing, tissue repair, asthma, rheumatoid arthritis, multiple sclerosis. Nucleic acid encoding PRO polypeptides are useful in molecular blology including uses as hybridisation probes and in the generation of antisense RNA and DNA, for preparing PRO polypeptides, conservation of antisense RNA and DNA for preparing PRO polypeptides, conservation of antisense RNA and DNA for preparing PRO polypeptides, conservating transgenic animals or knockout animals. The PRO antibodies are useful for tissue typing. PRO antibodies are useful for tissue so serum and conservating the series and their machenical staining and/or assay of sample fluids. Anti-PRO antibodies are useful in diagnostic assays for conservation of affinity purification of PRO for recombinant cell culture or natural consemendation becomes an human secreted and conservations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human, PCR; primer; ss; PRO; secreted; transmembrane; gastrointestinal mucosa; mucosal lesion; skin disease; keratinocyte differentiation; psoriasis; Parkinson's disease; Alzheimer's diseases; amyotrophic lateral sclerosis; ALS; neuropathy;
                                                                                                                                                                                                                                                                                                                                                             Novel secreted and transmembrane polypeptides and polynucleotides encoding them useful for treating abnormal bleeding involved in gynecological diseases, skin diseases and neurodegenerative diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

Novel isolated native PRO polypeptide useful for treating Parkinson's disease, enterocolitis, Zollinger-Ellison syndrome gastrointestinal ulceration, Alzheimer's disease, amyotrophic lateral sclerosis, Usher syndrome

Example 36; Page 98; 469pp; English

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bloactive molecule to a cell expressing a PRO protein and for linking a concertive molecule to a cell expressing a PRO proteptides are useful for detecting other PRO polypeptides in a sample and for linking a bloactive molecule to a cell expressing a PRO polypeptides are useful compared to a cell expressing a PRO polypeptide and activity of a cell expressing PRO polypeptides. PRO polypeptide are also useful compared to a cell expressing PRO polypeptides. PRO polypeptides are also useful conformation and maintenance of gastrointestinal mucosa and the repair of acute and chronic mucosal lesions, skin diseases associated with abnormal keratinocyte of differentiation (e.g. psoriasis), Parkinson's disease. Alzheimer's differentiation (e.g. psoriasis), Parkinson's disease. Alzheimer's differentiation (e.g. psoriasis), parkinson's diseases. Alzheimer's cadditionally, disease related to uncontrolled cell growth, e.g. cancer. PRO polypeptides also serves as tumour specific antigens which may be exploited as therapeutic targets for anti-tumour drugs, and are also erves as tumour specific antigens which may be exploited as therapeutically in vivo for lessening the effects of viral infection. The PRO polypeptides can be also used in assays to determine contitith and a roll in neurodegenerative diseases or their reversal, as an antithrombotic agent with reduced risk for haemorrhage as compared with heparin, in treating other PRO-associated disorders, in modulating endometrial bleeding angiogenesis, and may also have an effect on kidney

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          05-OCT-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     08-SEP-
        tissue. PRO polypeptides and their portions affect the expression of genes which have a role in apoptosis. The polynucleotides are useful in and-cular biology including uses as hybridisation probes for cDNA library to isolate the full-length PRO cDNA or to isolate other cDNAs, in the generating transgenic animals or chromosome and gene mapping, in the generating transgenic animals or knockout animals which are useful in the development and screening of therapeutically useful reagents, as probes and for the genetic analysis of individuals which are useful in the development and screening of therapeutic agents, for as probes and for the genetic analysis of individuals with genetic disorders as well as for the proteins are useful are protein and for chromosome identification. The proteins are useful are useful as molecular marker for protein electrophoresis purposes, as charapeutic agents, for screening compounds to identify those that mimic the PRO polypeptide (agonists) or prevent the effect of the PRO polypeptide (agonists) or prevent the effect of the PRO cloppeptide (antagonists). The polynucleotides and proteins are useful collypeptide (and of or assay of sample fluids. Anti-PRO antibodies are useful in diagnostic assays for PRO e.g. detecting its expression in specific calls, itssues or serum and for affinity purification of PRO from recombinant cell culture or natural sources. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The equence presented is a PCR primer which was used to amplify a PRO or polymention.
                                                                                                                                                                                                                                                                                                                                                                         ö

Matches RESULT 19 ACD66978 ò 셤 cand the nuclear discinges isolated by the polypeptides can be used to raise and the nuclear discinges isolated by the polypeptides can be used to raise inthodies that specifically bind to the PRO polypeptide. For linking a consideration biological activity of a call. PRO polypeptide. The PRO bioactive molecule to a call expressing a PRO polypeptide. The PRO bioactive molecule to a call expressing a PRO polypeptide. The PRO bioactive molecule to a call expressing a PRO polypeptide. The PRO polypeptide artibodies are useful for modulating the biological activity of a call expressing PRO polypeptides. PRO polypeptides are also useful for the consideration and maintenance of gastrointestinal mucosa and the repair of acute and chronic mucosal cof gastrointestinal mucosa and the repair of acute and chronic mucosal cof gastrointestinal mucosa and the repair of acute and chronic mucosal cof gastrointestinal mucosa and the repair of acute and chronic mucosal cof gastrointestinal mucosa and the repair of acute and chronic mucosal cof gastrointestinal mucosa and the repair of acute and chronic mucosal cofficential properties a sociated with abnormal keratinocyte diseases anyotrophic lateral sclossis (ALS), neuropathies and calculation (e.g. psoriasis) Parkinson's disease, anyotrophic lateral sclossis (ALS), neuropathies and calculation. The PRO polypeptides can be also used in assays to determine infection. The PRO polypeptides can be also used in assays to determine if thas a role in neurodegenerative disorders in modulating cantity properties and their portions affect the expression of antitatory to isolate the full-length PRO cassociated disorders, in modulating of concernation probes for connecting and poptodis. The polymcloticides are useful in the generation of antisense RNA and DNA, to isolate the full-length PRO cassociated disorders, in modulating of the reparting and poptodis, or isolate the full-length PRO cassociated concernation of antisense RNA and DNA, to isolate the full-length PRO cassociated concernatio The invention discloses isolated PRO secreted/transmembrane polypeptides New secreted and transmembrane polypeptides useful for treating skin, neurodegenerative diseases, asthma, rheumatoid arthritis, psoriasis and multiple sclerosis. recombinant cell culture or natural sources. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequence presented is a PCR primer which was used to amplify a PRO ME, Goddard A; Kljavin IJ; Ferrara N; Tumas D; Botstein D, Desnoyers L, Eaton DL, Fong S, Gao W, Gerber H, Gerritsen erimaldi JC, Gurney AL, Hillan KJ, an J, Paoni NF, Roy MA, Stewart TA, Example 36; SEQ ID NO 229; 471pp; English. polynucleotide of the invention. 30-MAR-2000; 2000WO-US008439. 22-MAY-2000; 2000WO-US014042. 02-JUN-2000; 2000WO-US015264. 28-JUL-2000; 2000WO-US020710. 24-AUG-2000; 2000WO-US023328. 18-SEP-2000; 2000US-00665350. (GETH) GENENTECH INC.

ME, Goddard A; Kljavin IJ; Tumas D; Ferrara N; Desnoyers L, Eaton DL, W, Gerber H, Gerritsen Gurney AL, Hillan KJ, NF, Roy MA, Stewart TA, Ashkenazi A, Botstein D, Desnoyers L, Filvaroff E, Fong S, Gao W, Gerber H Godowski PJ, Grimaldi JC, Gurney AL, Mather JP, Pan J, Paoni NF, Roy MA, Williams PM, Wood WI;

WPI; 2003-512316/48.

New genes and secreted and transmembrane polypeptides (e.g. PRO245 or PRO1868), useful for treating or diagnosing e.g. cancers, atherosclerosis, infertility, stroke, AIDS or multiple sclerosis in mammals.

Example 37; Page 103; 476pp; English.

The invention relates to an isolated nucleic acid molecule comprising a agequence with at least 80% identity to: (a) a nucleotide encoding any of 61 PRO (secreted and transmembrane protein) polypeptides appearing as AB032756-AB032816; or (b) any of 61 nucleotide sequences having 50-4053bp

```
Tury uncleased in the particularity, or the full rengular county bequences of any these of nucleotide sequences. Also included are the isolated PRO polypeptide (lacking its associated signal peptide or an extracellular domain of the PRO polypeptide, with or lacking its associated signal peptide or an extracellular comprising the vector comprising the nucleic acid molecule, a host cell comprising the vector (used to produce the PRO polypeptide or an extracellular comprising the PRO polypeptide fused to a heterologous amino acid sequence, an anti-PRO antibody, detecting PRO245 or PRO1868 polypeptides, inking a bioactive molecule to a cell expressing a PRO245 or PRO1868 polypeptide and modulating at least one biological activity of a cell expressing the PRO245 or PRO1868 polypeptide. The PRO polypeptides or polymucleotides are useful as pharmaceuticals, diagnostics, biosensors or polymucleotides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. These are particularly useful for diagnostics, biosensors or bioreactors, rheese are particularly useful for diagnostics, malignary (e.g. cancers), strokes, heart attacks, hypertension, gastroincestinal ulcarations, Parkinson's diseases, Alzheimer's disease, or AlDS in the body, and in wound healing or tissue repair. The PRO polypeptides are useful as hybridisation probes, or for screening libraries of human consecutions in the propertic care useful as hybridisation probes, or for screening libraries of human consequence is an oligomucleotide (PCR primer or probe) used in the cestorion of a PRO CDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

                                                                                                                                                                                                                                                                                                                                                         20-NOV-1998
                                                                                                                                                                                                                                                                                                                                                                                                 08-SEP-1999
```

```
The invention relates to human PRO polypeptides (secreted and transmembrane polypeptides) and the PRO polynucleotides encoding them. The PRO polypeptides and polynucleotides can be used in diagnosing or treating abnormal bleeding involved in gynaecological diseases e.g. to avoid or lessen the need for hysterectomy. They can also be used in treating coronary ischaemic conditions, disorders associated with the preservation and maintenance of gastrointestinal mucosa and the repair of acute and chronic mucosal lesions, skin diseases associated with abnormal keratinocyte differentiation (e.g. psoriasis), Parkinson's disease, Alzheimer's disease, asthma, rheumatoid arthritis, multiple sollerosis, amyotrophic lateral scherosis (ALS), neuropathies and diseases related to uncontrolled cell growth, such as cancer. This sequence represents a PCR primer used to isolate a human PRO polynucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; PCR; primer; ss; PRO; secreted; transmembrane; therapeutic; tissue typing; immunohistochemical staining; gene therapy; neconatal heart; vascular endothelial growth factor; VEGF; proliferation; endothelial cell; etimulated T-lymphocyte; retinal neuron; rod photoreceptor cell; c-fos; glucose; FFA; chondrocyte; cardiac insufficiency disorder; wound; cancer; tumour; retinal disorder; hypoinsulinaemia; bone disorder; cartilage disorder; sport injury; arthritis; cardiant; vulnerary; cytostatic; ophthalmological; osteopathic; antiarthritis; anorectic.
                                                                                                                                                                                                                                                                                                                                                                                                    Novel secreted and transmembrane PRO polypeptides and polynucleotides encoding them, useful for treating abnormal bleeding involved in gynecological diseases, skin diseases and neurodegenerative diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

(GETH) GENENTECH INC.

Ferrara N; ME, Goddard A; Kljavin IJ; Tumas D; Ashkenazi A, Botstein D, Desnoyers L, Eaton DL, E Filvaroff B, Fong S, Gao W, Gerber H, Gerritsen N Godowski PJ, Grimaldi JC, Gurney AL, Hillan KJ, F Mather JP, Pan J, Paoni NF, Roy MA, Stewart TA, Williams PM, Wood WI; WPI; 2003-521801/49.

New genes encoding for secreted and transmembrane PRO polypeptides, useful for treating e.g. cardiac insufficiency disorders, wounds, cancers, obesity, diabetes, hyperinsulinemia, hypoinsulinemia, or arthritis.

Example 36; SEQ ID NO 229; 476pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antithodies that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a call expressing a PRO polypeptide, for Inking a contection of the properties are useful contective molecule to a call expressing a PRO polypeptides are useful for detecting other PRO polypeptides in a sample and for linking a contective molecule to a call expressing a PRO polypeptide. The PRO polypeptides are useful for modulating the biological activity of a call expressing a properties. The PRO polypeptides or contective molecule to a call expressing a properties. The PRO polypeptides or polymented are useful as pharmaceuticals, diagnostics, biosensors or polymelectides are useful as paramaceuticals, diagnostics, biosensors or proliferation of endothelial calls growth factor (VEGF) stimulated proliferation of conforceceptor calls, inducing proliferation of conforceceptor calls, inducing proliferation of conforceceptor calls, inducing proliferation and/or recalls, modulating glucose or PRA uptake, inducing proliferation and/or recalls, modulating cardiac insufficiency disorders, wounds, cancerous tumours, retinal disorders or injuries (e.g. loss of sight due to creinitis pigmentosum), obesity, diabetes, hyperinsulinaemia, or bone or cartilage disorders (e.g. sports injuries or arthritis) in mammals. PRO polypeptides and their portions affect the expression of genes which have a cole in cell death. The polymucleotides are useful in molecular biology including uses as hybridisation probabes or correspondent and gene mapping, in the generation of antisense RNA and DNA, for preparing PRO polypeptides and their portions and sor and some mapping, in the generation of antisense Contection animals which are useful in the development and contection and provides and for the polyment and sor kenting and provides and provides and provided the proportion and gene mapping, in the gene

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     15-SEP-
     recombinantly expressing the protein and for chromosome identification. The proteins are useful as molecular marker for protein electrophoresis purposes, as therapeutic agents, for screening compounds to identify those that mimic the PRO polypeptide (agonists) or prevent the effect of the PRO polypeptide (agonists). The polynucleotides and proteins are immunohistochemical staining and/or assay of sample fluids. Anti-PRO antibodies are useful for tassue typing, PRO antibodies are useful for antibodies are useful in diagnostic assays for PRO e.g. detecting its expression in specific cells, tissues or serum and for affinity purification of PRO from recombinant cell culture or natural sources. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequence presented is a PCR primer which was used to amplify a PRO polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   gastrointestinal mucosa; mucosal lesion; skin disease;

Novel PRO polypeptides useful for treating Parkinson's disease, Alzheimer's disease, enterocolitis, Zollinger-Ellison syndrome, psoriasis, epidermoid carcinoma of the vulva and gliomas, gynecological diseases

Example 36; SEQ ID NO 229; 479pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides can define auclate acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a cell expressing a PRO polypeptide, for inking at least one biological activity of a cell. PRO polypeptide, are useful for modulating at least one biological activity of a cell. PRO polypeptide are useful for determine the properties. The properties are activated to cell expressing a PRO polypeptide are useful for modulating the biological activity of a cell expressing a PRO polypeptide. The PRO polypeptide articological activity of a cell expressing and the rapair of actual maintenance of gastrointesinal mucosa and the rapair of actual maintenance of gastrointesinal mucosa and the rapair of actual maintenance of gastrointesinal mucosa and the rapair of actual maintenance of gastrointesinal mucosa and the rapair of actual maintenance of gastrointesinal mucosa and the rapair of actual maintenance of gastrointesinal mucosa and the rapair of actual maintenance of gastrointesinal mucosa and the rapair of actual maintenance of gastrointesinal mucosa and the rapair of actual may and a daditionally, disease related to uncontrolled cell growth, e.g. cancer. PRO polypeptides also serves as tumour specific antigens which may be expension of maintenance of maintenance of maintenance and additionally, disease related to uncontrolled cell growth, e.g. cancer. PRO polypeptides and their portions affect the expression of material may also have an effect on kidney to isolate the full-leading angiogenesis, and may also have an effect on kidney to isolate the full. Leading angiogenesis, and may also have an effect on solate the full-leading angiogenesis, and may also have a role in apoptosis. The polymucleotides are useful in chargemine and properties and properties and their properties and propertie

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to human PRO polypeptides and the polynucleotides encoding them. The polypeptides and polynucleotides are used for treating diseases related to growth or survival of nerve cells such as Parkinson's disease, Alzheimer's disease, amyotrophic lateral sclerosis (ALS) and neuropathies, diseases related to uncontrolled cell growth such as cancer, viral infections, Usher's syndrome, haemorrhage, entercoolitis, Zollinger-Elison syndrome, passeron, entercoolitis, and microvillus atrophy, skin diseases such as psoriasis and epithelial ancers, endometrial bleeding, angiogenesis, ischaemic conditions, asthma, rheumacoid arthritis, multiple sclerosis, inflammatory diseases, atherosclerosis, cardiac injury, infertility, birth defects, premature
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ferrara N;

```
The invention discloses isolated PRO secreted/transmembrane polypeptides can durince acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptides are useful biological activity of a cell expressing a PRO polypeptides are useful concernive molecule to a cell expressing a PRO polypeptides are useful concernive molecule to a cell expressing a PRO polypeptides are useful concernive molecule to a cell expressing a PRO polypeptide and the PRO polypeptide antibodies are useful for modulating the biological activity of a cell expressing PRO polypeptide. The PRO polypeptide antibodies are useful for modulating the biological activity of a cell expressing a pRO polypeptide and maintenance of gastroinfestinal mucosa and the repair of acted informic mucosal for treating disorders associated with the preservation and maintenance of gastroinfestinal mucosa and the repair of acted informic mucosal lesions, skin diseases associated with abnormal keratinocyte differentiation (e.g. psoriasis), Parkinson's disease, Alizheimer's diseases, amyorrophic lesteral action for properties also serves as tumour specific antigens which may be disposed the arapeutic largets for anti-tumour drugs, and are also employed therapeutically in vivo for lessening the effects of viral conformation. The PRO polypeptides and under professor of microin and properties are useful in the arapid of activities for the part in the arapid properties and their professor of antithrombotic agent with reduced risk for hemorrhage as compared with have a role in apoptosis. The polymuclecides are useful in the development and screening of therapeutically useful reagents, as probes and for the generation of chromosome and gene mapping, in the generation of antisense RNA and DNA, for preparing PRO polypeptides, and their professor and proteins are useful in the development and screening of therapeutically useful reagents, as probes and for the generation of antisent and professor of individuals with genetic disorde
    æ
secreted and transmembrane PRO polypeptides e.g. PRO187, which is per of the epidermal growth factor-8 (EGF-8) family of proteins,
                                                                                       Example 36; SEQ ID NO 229; 471pp; English.
                                           useful for treating cancer.

New secreted and transmembrane PRO polypeptides, useful for treating cancer, skin disorders, neurodegenerative diseases, and for lessening the effects of viral infection. WPI; 2003-521802/49.

Example 36; SEQ ID NO 229; 473pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a cell expressing a PRO protein and for nuclating a conference of the properties and for linking a conference of conference of properties in a sample and for linking a conference of conference of properties are useful for discretive molecule to a cell expressing a PRO polypeptides. The PRO polypeptide antibodies are useful for modulating the biological activity of a cell expressing a PRO polypeptide are useful for modulating the biological activity of a cell expressing with the preservation and maintenance of conference of gastrointestinal mucosa and the repair of acute and chronic mucosal lesions, skin diseases associated with abnormal keratinocyte differentiation (e.g. psoriaais), parkinson's disease, Alzheimer's diseases, amyotrophic lateral sclerosis (ALS), neuropathies and additionally, disease related to uncontrolled cell growth, e.g. cancer. PRO polypeptides also serves as tumour specific antigens which may be exploited as therapeutic targets for anti-tumour drugs, and are also exploited as therapeutic targets for anti-tumour drugs, and are also comployed therapeuticapeutically in vivo for lessening the effects of viral ciffection. The PRO polypeptides can be also used in assays to determine if it has a role in neurodegenerative diseases or their reversal, as an

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         12-DEC-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          24-NOV-
            cc antithrombotic agent with reduced risk for haemorrhage as compared with heparin, in treating other PRO-associated disorders, in modulating conferencial bleeding angiogeneeis, and may also have an effect on kidney tissue. PRO polypeptides and their portions affect the expression of consensual biology including uses as hybridisation probes for cDNA library to isolate the full-length PRO cDNA or to isolate other cDNAs, in chromosome and gene mapping, in the generating transgenic animals or chromosome and gene mapping, in the generating transgenic animals or chromosome and gene mapping, in the generating transgenic animals or chromosome and gene mapping, in the development and screening of therapeutically useful reagents, as probes and for the genetic analysis of individuals with genetic disorders as well as for recombinantly expressing the protein and for chromosome identification. The proteins are useful as molecular marker for protein electrophoresis purposes, as therapeutic agents, for screening compounds to identification. The proteins are useful contracted and proteins are useful in colypeptide (agonists). The polymucleotides and proteins are useful in colypeptide (angonists). The polymucleotides and proteins are useful in colypeptide (angonists). The polymucleotides and proteins are useful in calagnostic assays for PRO eg. detecting its expression in specific colls, itssues or serum and for affinity purification of PRO from recombinant cell culture or natural sources. The PRO genes may also be sequence presented its a PCR primer which was used to amplify a PRO containing and con
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; PCR; primer; ss; PRO; secreted; transmembrane; gastrointestinal mucosa; mucosal lesion; skin disease; kertinocyte differentiation; psoriasis; Parkinson's disease; Alstanation; psoriasis; Parkinson's disease; amyotrophic lateral sclerosis; ALS; neuropathy; cell growth; cancer; tumour; viral infection; neurodegenerative disease; antithrombotic agent; haemorrhage; endometrial bleeding angiogenesis; kidney tissue; apoptosis; therapeutic; tissue typing; immunohistochemical staining; gene therapy; nootropic; neuroprotective; cytostatic; virucide; anticoagulant.

Example 36; SEQ ID NO 229; 468pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise and the nucleic acid encoding them. The polypeptides have be used to raise and the nucleic acid encoding them. The polypeptides are useful for modulating at least one biological activity of a cell. PRO polypeptide. The PRO plotypeptide are useful for modulating the biological activity of a cell. PRO polypeptide. The PRO polypeptide antibodies ace useful for modulating the biological activity of a cell expressing a PRO polypeptide. The PRO polypeptide antibodies are useful for modulating the biological activity of a cell expressing a PRO polypeptide. The PRO polypeptide antibodies associated with the preservation and maintenance of gastrointesinal muces and the repair of actual machinal muces and the repair of actual machinal mac

, Goddard A; javin IJ; Ferrara N; Tumas D; Ashkenazi A, Botstein D, Desnoyers L, Eaton DL, F Filvaroff E, Fong S, Gao W, Gerber H, Gerritsen M Godowski PJ, Grimaldi JC, Gurney AL, Hillan KJ, K Mather JP, Pan J, Paoni NF, Roy MA, Stewart TA, Pan J, Pac. M, Wood WI; Mather JP, F Williams PM,

WPI; 2003-531434/50.

New isolated nucleic acid encoding a PRO polypeptide, e.g. PRO245 or PRO1868, useful in molecular biology, chromosome and gene mapping, in generating antisense RNA and DNA, and in gene therapy.

Example 36; SEQ ID NO 229; 475pp; English.

The Invention discloses isolated known the polypoptides can be used to raise and the nucleic acid encoding them. The polypoptides can be used to raise and the nucleic acid encoding them. The polypoptides for linking a bioactive molecule to a cell expressing a PRO protein and for modulating to bioactive molecule to a cell expressing a PRO protein and for modulating to polypoptides. The PRO polypoptides are useful for modulating the biological activity of a cell expressing a PRO polypoptide. The PRO Dispeptide antibodies are useful for modulating the biological activity of a cell expressing PRO polypoptides. PRO polypoptide and an antiterance of acel expressing PRO polypoptides. PRO polypoptide and an antiterance of gastrointestinal muccea and the repair of acute and chronic mucceal differentiation (e.g. poorties) barkinson's disease, Albeimer's differentiation (e.g. poorties), parkinson's disease, Albeimer's also determine and difficularly disease related to uncontrolled call growth, e.g. cancer. PRO polypoptides also serves as tumour specific antigens which may be additionally, disease related to uncontrolled anti-tumour drugs, and are also employed therapeutically in vivo for lessening the effects of viral infection. The PRO polypoptides can be also used in sease; and are also employed therapeutically in vivo for lessening the effects of viral cheparin, in treating other PRO-associated disorders, in modulating cheparin, in treating other PRO-associated disorders, in modulating other properides and their portions effect the expression of genes which have a role in apoptosis. The polymolectides are useful in melecular mapping, in the generating transgenic animals of the forth and protein and for chemographic and protein and pr ; 0 invention discloses isolated PRO secreted/transmembrane polypeptides gastrointestinal mucosa; mucosal lesion; skin disease; keratinocyte differentiation; psoriasis; Parkinson's disease; Alzheimer's diseases; amyotrophic lateral sclerosis; ALS; neuropathy; cell growth; cancer; tumour; viral infection; neurodegenerative disease; Gaps ; 0.4%; Score 14.4; DB 1; Length 18; 93.8%; Pred. Novel isolated secreted and transmembrane PRO polypeptide, useful for tissue typing, treating Parkinson's disease, Alzheimer's disease, birth defects, cancer.

Example 36; SEQ ID NO 229; 464pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise and the nucleic acid encoding them. The polypeptides can be used to raise at least one biological activity of a cell. PRO polypeptide are useful for detecting other PRO polypeptides in a sample and for linking a for a tleast one biological activity of a cell. PRO polypeptides are useful bloactive molecule to a cell expressing a PRO polypeptide. The PRO polypeptide antibodies are useful for modulating the biological activity of a cell expressing PRO polypeptides. The PRO polypeptide antibodies are useful for modulating the biological activity of a cell expressing PRO polypeptides. PRO polypeptides are also useful.

CC of acell expressing PRO polypeptides. PRO polypeptides are also useful cor treating disordars associated with the preservation and maintenance of gastrointestinal mucosa and the repair of acute and chronic mucosal lesions, skin diseases associated with abnormal keratinocyte and confidence and chronic lateral sclerosis (ALS), neuropathies and diseases, amyotrophic lateral sclerosis (ALS), neuropathies and additionally disease related to uncontrolled cell growth, e.g. cancer. PRO polypeptides also serves as tumour specific antigens which may be exploited as therapeutic targets for anti-tumour drugs, and are also expect as tumour specific antigens which may colypeptides can be also used in assays to determine if it has a role in neurodegenesative diseases or their reversal, as an endometrial bleeding angiogenesis, and may also have an effect on kidney theorem which have a role in apoptosis. The polymucleotides are useful in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                20-NOV-
                  molecular biology including uses as hybridisation probes for CDNA library to isolate the full-length PRO CDNA or to isolate other CDNAs, in chancosome and gene mapping, in the generation of antisense RNA and DNA, for preparing PRO polypeptides, for generating transgenic animals or knockout animals which are useful in the development and screening of therapeutically useful reagents, as probes and for the genetic analysis of individuals which are useful as probes and for the genetic analysis of individuals with genetic disorders as well as for recombinantly expressing the protein and for chromosome identification. The proteins are useful as molecular marker for protein electrophoresis purposes, as the PRO polypeptide (agonists). The polymucleotides and proteins are useful chanced (attaining and/or assay of sample fluids. Anti-PRO antibodies are useful in diagnostic assays for PRO e.g. detecting its expression in specific clasmostic assays for PRO e.g. detecting its expression in specific cells, tissues or serum and for affinity purification of PRO from seed in gene therapy, particularly for replacing a defective gene. The sequence presented is a PCR primer which was used to amplify a PRO entimed the angelian and a second to amplify a PRO entimed the angelian and a series of the angelian and a second to amplify a PRO entimed the angelian and a series and angelian and and and angelian and and and an angelian and and an and and and any and an angelian and and any and an and any a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        14-SEP-
The invention relates to human PRO polypeptides (secreted and transmembrane polypeptides) and the polymuclectides encoding them. The polypeptides are useful for detecting PRO polypeptides and for linking a bioactive molecule to a cell expressing the polypeptides, where the bioactive molecule is a toxin, radiolabel or an antibody. The bioactive material causes the death of the cell. The polypeptides or antibodies pecific to the polypeptides are useful for modulating at least one biological activity of a cell expressing the polypeptides. The biological activity of a cell expressing the polypeptides. The biological activity of a cell expressing the polypeptides. The polypeptides are useful for treating disorders associated with leukocyte homing such as asthma, rheumatoid arthritis, psoriasis and multiple clerosis, repair of acute and chronic mucosal lesions such as clerosis, repair of acute and chronic mucosal lesions such as clerosist of the polypeptides. The polymuclectides are useful as hybridization probes, in chromosome and gene mapping, in generation of antisense RNA and DNA, in the preparation of RPCR), Northern analysis, southern analysis and Western analysis. This sequence represents a PCR polymer used in isolation of a human PRO polymuclectide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   gastrointestinal mucosa; mucosal lesion; skin disease; keratinocyte differentiation; psoriasis; Parkinson's disease; Alzheimer's diseases; amyotrophic lateral sclerosis; ALS; neuropathy; cell growth; cancer; tumour; viral infection; neurodegenerative disease; antithrombotic agent; haemorrhage; endometrial bleeding angiogenesis; kidney tissue; apptosis; therapeutic; tissue typing; immunohistochemical staining; gene therapy; nootropic; neuroprotective; cytostatic; virucide; anticoagulant.

(GETH) GENENTECH INC.

Ferrara N; ME, Goddard A; Kljavin IJ; Tumas D; Eaton DL, F I, Gerritsen N Hillan KJ, F Stewart TA, Ashkenazi A, Botstein D, Desnoyers L, Elivaroff E, Fong S, Gao W, Gerber H, Godowski PJ, Grimaldi JC, Gurney AL, H Mather JP, Pan J, Paoni NP, Roy MA, S Wood WI:

New isolated secreted and transmembrane polypeptide, useful for treating diseases, e.g. Parkinson's disease, Alzheimer's disease, amyotrophic lateral sclerosis, cancer, neuropathies, diabetes and psoriasis.

Example 36; Page 98; 467pp; English

The invention distoless isolated from the polypeptides can be used to raise and the nuclear acid encoding them. The polypeptides can be used to raise antibodies that acid encoding them. The polypeptides can be used to raise at least one biological activity of a cell. PRO polypeptides are useful to deactive molecule to a cell expressing a PRO polypeptide. The PRO polypeptide attloades are useful for modulating the bioactive molecule to a cell expressing a PRO polypeptide are also useful configuration and maintenance of a cell expressing PRO polypeptides are proposed are useful for modulating the biological activity of a cell expressing PRO polypeptides are also useful corf gastrointestinal mucosa and the repair of acute and chronic mucosal for treating disorders associated with abnormal keratinocyte molecule (e.g. pooriasis). Parkinson's disease, Alzheimer's diseases, amyotrophic lateral sclerosis (ALS), neuropathies and chronic mucosal clifferentiation (e.g. pooriasis). Parkinson's disease, and the respect of actific antisgens which may be cappetide as therapeutic targets for anti-tumour drugs, and are also additionally, disease related to uncontrolled cell growth, e.g. cancer. CC PRO polypeptides also serves as tumour specific antisgens which may be expression of additionally, disease related to uncontrolled cell growth, e.g. cancer. CC moleculas also serves as tumour specific antisgens which may be expression of antithrombotic agent with reduced risk for haemorrhage as compared with the properties can be also used in assays to determine if it has a role in neurodegenerative diseases or their reversal, as an entit portions affect the expression of concerning the parting other PRO-sasociated disorders, in modulating other PRO-sasociated disorders, in modulating other PRO-sasociated disorders, or modulating of corposeme and gene mapping, in the generation of antisense RNA and DNA, corposed and gene mapping, in the generation relations and the force of sensation and served of the respection and gene mapping, in t The invention discloses isolated PRO secreted/transmembrane polypeptides

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Alzheimer's diseases; amyotrophic lateral sclerosis; ALS; neuropathy; cell growth; cancer; tumour; viral infection; neurodegenerative disease; antithrombotic agent; haemorrhage; endometrial bleeding anglogenesis; kidney tissue; apoptosis; therapeutic; tissue typing; immunohistochemical staining; gene therapy; nootropic; neuroprotective; cytostatic; virucide; anticoagulant.
polypeptide (antagonists). The polymucleotides and proteins are useful for tissue typing. PRO antibodies are useful for immunohistochemical staining and/or assay of sample fluids. Anti-PRO antibodies are useful diagnostic assays for PRO eg. detecting its expression in specific cells, tissues or serum and for affinity purification of PRO from recombinant cell culture or natural sources. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequence presented is a PCR primer which was used to amplify a PRO polymucleotide of the invention.
                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                            .

Ferrara N; ME, Goddard A; Kljavin IJ;

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodise that specifically bind to the PRO polypeptides for linking a caric dencoding them. The polypeptides can be used to raise antibodise that specifically bind to the PRO polypeptide. For iluking a taleast one biological activity of a cell. PRO polypeptide. The PRO polypeptide are useful for modulating the biological activity of a cell. PRO polypeptide are useful for modulating the biological activity of collaborative molecule to a cell expressing PRO polypeptides. PRO polypeptide are also useful for treating disorders associated with the preservation and maintenance of gastrointestinal mucosa and the repair of acute and chronic mucosal lesions, skin diseases associated with abnormal keratinocyte differentiation (e.g. psoriasis), Parkinson's disease, anyotrophic largets for articumour drugs, and are also explosited as therapeutically in vivo for lessening the effects of viral infection. The PRO polypeptides can be also used in assays to determine explosited as therapeutically in vivo for lessening the effects of viral infection. The PRO polypeptides can be also used in assays to determine explosited as role in neurodegenesis, and may also have an effect on kidney tissue. PRO polypeptides can be also used in assays to determine the partin in treating other PRO-associated disorders, in modulating endometrial bleeding and opensors and also have an effect on kidney tissue. PRO polypeptides and their portions affect the expression of successing the protection and their portions and so the construction of antisense RNA and chromosome and gene mapping, in the development and sortening of the processing the protein and for chromosome and protein and for chromosome identification of antisense purpose the represent and for chromosome identification. The PRO polypeptides are useful in the development capents, for screening compounds to identify the protein and for chromos used in gene therapy, particularly for replacing a defective gene. The sequence presented is a PCR primer which was used to amplify a PRO polynuclectide of the invention. Novel isolated native PRO polypeptide useful for tissue typing, modulating biological activity of cell, as molecular weight markers in protein electrophoresis, for treating enterocolitis, Zollinger-Ellison Paoni NF, Roy MA, Stewart TA, Tumas D; Sequence 18 BP; 3 A; 5 C; 7 G; 3 T; 0 U; 0 Other; Example 36; Page 104; 475pp; English. Mather JP, Pan J, Pac Williams PM, Wood WI; WPI; 2003-765412/72. syndrome.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a cell expressing a PRO polypeptide, for linking a taleast one biological activity of a cell. PRO polypeptides are useful for detecting other PRO polypeptides in a sample and for linking a bioactive molecule to a cell expressing a PRO polypeptide. The PRO polypeptide antibodies are useful for modulating the biological activity of a cell expressing PRO polypeptides. The PRO polypeptide are useful as pharmaceuticals, disgnostics, biosensors or polymuclectides are useful for stimulating hypertrophy of neonatal heart, inhibiting vascular endothelial growth factor (VEGE)-etimulated proliferation of endothelial cells, modulating the proliferation of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     01-DEC-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        4-SEP
 Stimulated 7-1 ympnocytes, enhanding fine survival or proliferation of cells, modulating glucose or FFA uptake, inducing proliferation and/or rectinal neurons or rod photoreceptor cells, inducing proliferation and/or rectinal membran of chondrocytes. In particular, these are useful for detecting or treating cardiac insufficiency disorders, wounds, cancerous tumours, retinal disorders or injuries (e.g. loss of sight due to retinitis pigmentosum), obesity, diabetes, hyperinsulinaemia, or bone or cartilage disorders (e.g. sports injuries or arbitis) in mammals. PRO polypetides and their portions affect the expression of genes which have a role in cell death. The polymucleotides or arbitis pigmentosum), obligate the full-length PRO cDNA or to isolate other contains and gene mapping, in the generation of antisense RNA and DNA, for preparing PRO polypetides, for generation of antisense RNA and DNA, for preparing PRO polypetides, for generation of antisense RNA cond DNA, for preparing PRO polypetides, for generation of antisense RNA cond DNA, for preparing PRO polypetides, for generation of antisense RNA cond DNA, for preparing PRO polypetides, for generation of antisense RNA cond DNA, for preparing PRO pulpeptide (alsorders as well as for recombinantly expressing the protein and for chromosome identification. The proteins are useful as molecular marker for protein electrophoresis or those that mimic the PRO polypeptide (antagonists). The polymucleotides and proteins are useful in diagnostic assays for RNO e.g. detecting its expression in specific cells, tissues or serum and for affinity or expression in specific cells, tissues or serum and for affinity and contibodies are useful in diagnostic assays for RNO e.g. detecting securing a generation gene. The sequence presented is a PCR primer which was used to maplify a PRO polymucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; PCR; primer; ss; PRO; secreted; transmembrane; therapeutic; tissue typing; immunohistochemical staining; gene therapy; neconatal heart; vascular endothelial growth factor; VEGF; proliferation; endothelial cell; stimulated T-lymphocyte; retinal neuron; rod photoreceptor cell; c-fos; glucose; FRA; chondrocyte; cardiac insufficiency disorder; wound; cancer; tumour; retinal disorder; retinits pigmentosum; obesity; diabete; hyperinsulinaemia; hypoinsulinaemia; bone disorder; cartiage disorder; sport injury; arthritis; cardiant; vulnerary; cytostatic; ophthalmological; osteopathic; antiarthritic; anorectic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleid acid encoding them. The polypeptides can thibodies that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a cell expressing a PRO protein and for modulating a call expressing a PRO polypeptide are useful car detecting other PRO polypeptides in a sample and for linking a bioactive molecule to a cell expressing a PRO polypeptides. The PRO polypeptide antibodies are useful for modulating the biological activity of a cell expressing a PRO polypeptides or polypeptides are useful so a cell expressing a PRO polypeptide or proliferation of polypeptide antibodies are useful for modulating the biological activity of polypeptide antibodies are useful for modulating the proliferation of coloreactors. These are useful as pharmaceuticals diagnostics biosensors or bioreactors. These are useful for stimulated to proliferation of conditional cells, modulating the proliferation of coloreaceptor cells, inducing crioriferation of stimulated 1-ymphocytes, enhancing the survival or proliferation of coloreaceptor cells, inducing proliferation and/or recills, modulating glucose or FPA uprake. Inducing proliferation and/or recills, modulating of the prolessor or injuries (e.g. loss of sight due to criorinitis pigmentosum), observy, diabetes, hyperinsulinaemia, hypoinsulinaemia, or bone or cartilage disorders or sight due to cretinitis pigmentosum), observy, diabetes, hyperinsulinaemia, hypoinsulinaemia, or bone or cartilage disorders (e.g. sports injuries or conversion of genes which have a role in cell death. The polymocetical arthritis or useful molecular biology including uses as hypridiation probes or convolution by expression of genes which have a role in cell death. The polymocetic and bysic for preparting PRO polypeptides, for generating transgenic conformantly expressing the procein and gene mapping, including uses as hypridiated or classification. The proteins are useful a minals or knockout animals with genetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel secreted and transmembrane polypeptides and polynucleotides encoding them useful for treating skin, neurodegenerative diseases, as an antithrombotic agent and for inducing endothelial cell apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                   Ferrara N;

PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequence presented is a PCR primer which was used to amplify a PRO polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; PCR; primer; ss; PRO; secreted; transmembrane; therapeutic; tissue typing; immunohistochemical staining; gene therapy; nemenatal heart; vascular endothelial growth factor; VEGF; proliferation; endothelial cell; stimulated T-lymphocyte; retinal neuron; rod photoreceptor cell; c-fos; glucose; FRA; chondrocyte; cardiac insufficiency disorder; wound; cancer; tumour; retinal disorder; retinitis pigmentosum; obesity; diabete; hyperinsulinaemia; hyppinsulinaemia; bone disorder; cartilage disorder; sport injury; arthritis; cardiant; vulnezary; cytostatic; ophthalmological; osteopathic; antiarthritic; anorectic.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide for linking a bioactive molecule to a cell expressing a PRO polypeptide for inking a bioactive molecule to a cell expressing a PRO polypeptides are useful for detecting other PRO polypeptides in a sample and for linking a bioactive molecule to a cell expressing a PRO polypeptide and for linking a coll expressing a PRO polypeptide and activity of a cell expressing a PRO polypeptide or linking a bioactive molecule to a cell expressing a PRO polypeptide or linking a cell expressing PRO polypeptides. The PRO polypeptide or linking a cell expressing PRO polypeptides. The PRO polypeptide or linking a cell expression of a cell expression of proceeders. These are useful as pharmaceuticals, diagnostics, blossnors or collocations. These are useful for stimulating hypertrophy of meantal cells, modulating the proliferation of condorhelial growth factor (VEGF) stimulated proliferation of endochelial cells, inducing cropiferation of condorpoytes, enhancing the proliferation of condorpoytes, inducing proliferation of condorpoytes, inducing proliferation of condorpoytes, inducing cells, modulating cells, modulating cells, modulating proliferation of condorpoytes, inducing proliferation of condorpoytes, inducing proliferation of condorpoytes, inducing the proliferation of condorpoytes, inducing the proliferation of condorpoytes, inducing the proliferation of condorpoytes, or articladed disorders (e.g. sports inducing cells, modulating induced cartical cartical colls, modered, hypoinsulinaemia, or bone or carticaled disorders (e.g. sports inducing cells, hypoinsulinaemia, or bone or carticaled as proteins are useful for conformation of antisens RNA corposation of genes which have a role death. The polymorpoyers are useful in molecular biology including uses as hybridisation of conforted and blay, for preparing RRO polypeptides,

```
antibodies are useful in diagnostic assays for PRO e.g. detecting its expression in specific cells, tissues or serum and for affinity purification of PRO from recombinant cell culture or natural sources. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequence presented is a PCR primer which was used to amplify a PRO polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human, PCR, primer, 88, PRO, secreted, transmembrane, therapeutic, tissue typing, immunohistochemical staining, gene therapy;

Novel secreted and transmembrane polypeptide for modulating biological activity of cell expressing the polypeptide, identifying agonists or antagonists of polypeptide, and as molecular weight markers.

Example 36; SEQ ID NO 229; 476pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a cell expressing a PRO protein and for modulating at least one biological activity of a cell. PRO polypeptides are useful for deterting other PRO polypeptides in a sample and for linking a collypeptide antibodies are useful for modulating the biological activity of a cell expressing a PRO polypeptides or cell expressing a PRO polypeptides or cell expressing a planaceuticals, diagnostics, biosensors or polyncleotides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. These are useful for stimulating hypertrophy of neonatal collecation of endothelial cells, modulating hypertrophy of menatal proliferation of endothelial cells, modulating the proliferation of stimulated T-lymphocytes, enhancing the survival or proliferation of cells, modulating proliferation of cells, modulating proliferation and/or receils, modulating or treating cardiac insufficiency disorders, wounds, cancerous tumours, retinal disorders or injuries (e.g. sports injuries or retinitis pigmentosum), obesity, diabetes, hyperineulianiamia, or bone or cartilage disorders (e.g. sports injuries or

      cc arthritis) in mammals. PRO polypeptides and their portions affect the expression of genes which have a role in cell death. The polynucleotides are useful in molecular biology including uses as hybridisation probes for conversion probes as the probable of the relation probes conversions. The proparation of antisense RNA can DNA, for preparing PRO polypeptides, for generation of antisense RNA can DNA, for preparing PRO polypeptides, for generation of antisense RNA can DNA, for preparing PRO polypeptides, for generation of antisense RNA can DNA, for preparing the protein are useful in the development and screening of therapeutically useful reagents, as probes and for the combinantly expressing the protein and for chromosome identification. The proteins are useful as molecular marker for protein electrophoresis purposes, as therapeutic agents, for screening compounds to identify the PRO polypeptide (agonists) or prevent the effect of the PRO polypeptide (antagonists). The polymucleotides and proteins are useful in diagnostic assays for RO e.g. detecting its expression in specific cells, tissues or serum and for affinity can independent of PRO from recombinant cell culture or natural sources. The PRO polypeptide (from recombinant cell culture or natural sources. The PRO genes may also be used in gene therapy, particularly for replacing a cepture of amplify a PRO polypurce presented is a PCR primer which was used to amplify a PRO polypurce of the invention.

Matches 15; Conservative ઠે 셤 The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide for linking a bioactive molecule to a cell expressing a PRO polypeptide for linking a bioactive molecule to a cell expressing a RRO polypeptides. The PRO to detecting other PRO polypeptides in a sample and for linking a bioactive molecule to a cell expressing a RRO polypeptides. The PRO polypeptide antibodies are useful for modulating the biological activity of a cell expressing PRO polypeptides. The PRO polypeptides or polymethodical activity of a cell expressing PRO polypeptides. The PRO polypeptides or polymethodical activity of a cell expressing PRO polypeptides. The PRO polypeptides or polymethodical activity of proliferation of endothelial cells, inducing proliferation of formation of a cartilad activity of proliferation of endothelial cells, inducing proliferation of collar activity of activity of a cells, modulating glucose or FRA uptake, inducing proliferation and/or cells, modulating glucose or FRA uptake, inducing proliferation of chondrocytes. In particular, these are useful for cells, modulating or boseity, diabetes, hyperinalinamia, cancerous cretinitis pigmentosum), obesity, diabetes, hyperinalinamia, cancerous cretinitis pigmentosum), obesity, diabetes, hyperinalinamia, cancerous cretinitis pigmentosum), obesity, diabetes, hyperinalinamia, can be complement or bologopetides and their portion and or sartilage disorders as hybridisation probes or cartilage disorders (e.g. sports injuries or sufficient manners or polymethodical despression of genes which have a role in cell death. The polymethodies are useful in moderally which are useful in the development and screening of therapeutic antendamiantly expressing t purification of PRO from recombinant cell culture or natural sources. The RRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequence presented is a PCR primer which was used to amplify a PRO polynucleotide of the invention. Novel secreted and transmembrane polypeptides and polynucleotides encoding them useful for treating cancers, asthma, rheumatoid arthritis, neurological diseases, and skin diseases. WPI; 2003-585107/55.

Novel isolated PRO polypeptides e.g. PRO234 (useful for treating rheumatoid arthritis, psoriasis and multiple sclerosis) and PRO187 (useful for treating Alzheimer's disease, cancer).

Example 36; SEQ ID NO 229; 451pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise

contibodies that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a cell expressing a PRO protesh and for modulating cat it least one biological activity of a cell. PRO polypeptides are useful cat a cell expressing a PRO polypeptides are useful controlled and polypeptides or ports or in polypeptides or ports or including uses as hypridisation probes or polypeptides or polypeptides or ports or polypeptides or polypeptides or ports or polypeptides or ports or polypeptides or pol ö Gaps ö Query Match 0.4%; Score 14.4; DB 1; Length 18; Best Local Similarity 93.8%; Pred. Novel secreted and transmembrane polypeptides and polynucleotides encoding them useful for treating skin, neurodegenerative diseases, as an antithrombotic agent and for inducing endothelial cell apoptosis.

Example 36; SEQ ID NO 229; 470pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the mucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bloactive molecule to a cell expressing a PRO polypeptide are useful for detecting other PRO polypeptides in a sample and for modulating a bloactive molecule to a cell expressing a PRO polypeptide are useful for bloactive molecule to a cell expressing a PRO polypeptide are useful for polypeptide are useful for scimulating the biological activity of a cell expressing PRO polypeptides. The PRO polypeptide are useful as pharmaceuticals, diagnostics, blosensors or comply and are useful as pharmaceuticals, diagnostics, blosensors or bioreactors. These are useful for stimulating hypertrophy of neonatal complying vascular endothelial growth factor (VEGF)-stimulated complying vascular endothelial cells, modulating the proliferation of complying vascular endothelial cells, modulating co-fos in endothelial cells, modulating proliferation of chondrocytes, endoting proliferation and chondrocytes, inducing co-fos in endothelial cells, modulating prosecore properties of sight due to cells, modulating glucose or FPA uptake, inducing proliferation and chondrocytes. In particular, these are useful for reatinal disorders or injuries (e.g. ports injuries or retinitis pigmentosum), obesity, diabetes, hyperinsulinaemia, or bone or cartilage disorders (e.g. sports injuries or arthritis) in mammals. PRO polypeptides and their portions affect the expression of genes which have a role in cell death.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           29-NOV-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              24-NOV-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       07-NOV-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             13-SEP-
       ö
genetic analysis of individuals with genetic disorders as well as for the combinantly expressing the protein and for chromsome identification. The proteins are useful as molecular marker for protein electrophoresis purposes, as therapeutic agents, for screening compounds to identify those that mimic the PRO polypeptide (agonists) or prevent the effect of the PRO polypeptide (antagonists). The polymucleotides and proteins are useful for tissue typing. PRO antibodies are useful for immunohistochemical staining and/or assay of sample fluids. Anti-PRO antibodies are useful in diagnostic assays for PRO e.g. detecting its expression in specific cells, itssues or serum and for affinity purification of PRO from recombinant cell culture or natural sources. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequence presented is a PCR primer which was used to amplify a PRO polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              tissue typing; immunohistochemical staining; gene therapy; neonatal heart; vascular endothelial growth factor; VEGF; proliferation; endothelial cell; stimulated T-lymphocyte; retinal neuron; rod photoreceptor cell; c-fos; glucose; FFA; chondrocyte; cardiac insufficiency disorder; wound; cancer; tumour; retinal disorder; retinitis pigmentosum; obesity; diabete; hyperinaulinaemia; hypoinsullnaemia; bone disorder; cartilage disorder; sport injury; arthritis; cardiant; vulnerary; cytostatic; ophthalmological; osteopathic; antiarthritic; anorectic.

Novel PRO polypeptides useful for treating Parkinson's disease, Alzheimer's disease, enterocolitis, Zollinger-Ellison syndrome, psoriasis, epidermoid carcinoma of the vulva and gliomas, gynecological diseases.

Example 36; SEQ ID NO 229; 473pp; English.

The invention discloses isolated who secreted/transmembrane polypeptides on the mucleic acid encoding them. The polypeptides can be used to raise and the mucleic acid encoding them. The polypeptides can be used to raise bloactive molecule ace acell expressing a PRO protein and for inking a call expressing a PRO polypeptide. The PRO polypeptides are useful acivity of a cell. PRO polypeptide. The PRO polypeptide antibodies are useful for modulating the biological activity of a cell expressing a PRO polypeptide. The PRO polypeptide antibodies are useful for modulating the biological activity of a cell expressing PRO polypeptide. The PRO polypeptide antibodies are useful for stimulating hypertrophy of neonatal beart, inhibiting vascular endothelial growth factor (VEGP) stimulated controllers are useful for stimulating hypertrophy of neonatal heart, inhibiting vascular endothelial growth factor (VEGP) stimulated controllers of endothelial cells, modulating proliferation of endothelial cells, modulating proliferation of endotrocytes. In particular, these are useful for etimal neurons or rod photoreceptor cells, inducing proliferation and/or receival modulating glucose or FRA uptake, inducing proliferation and/or receival modulating glucose or FRA uptake, inducing proliferation and/or receival modulating or treating candar inagification of formatics (e.g. loss of sight due to retinities priments, retinial disorders or injuries (e.g. loss of sight due to retinities) in momentals, properties and their portions affect the expression of genes which have a role in cell death. The polymolecotides for cumular or knockout animals with genetic and pub. for preparing PRO polypeptides and their portions are useful in molecular marker for protein and for the genetic analysis of individuals with genetic disorders as well as therapeutic agents, for percenting compounds to identify the genetic analysis of individuals with genetic process, as therapeutic agents, in the generation of entering or therapeutic analysis of individuals wit antibodies are useful in diagnostic assays for PRO e.g. detecting its expression in specific cells, tissues or serum and for affinity purification of PRO from recombinant cell culture or natural sources. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequence presented is a PCR primer which was used to amplify a PRO polynucleotide of the invention. The invention discloses isolated PRO secreted/transmembrane polypeptides

Ferrara N; 1 ME, Goddard A; Kljavin IJ; Tumas D; Ashkenazi A, Botstein D, Desnoyers L, Eaton DL, Filvaroff E, Fong S, Gao W, Gebber H, Gerritsen Godowski PJ, Grimaldi JC, Gurney AL, Hillan KJ, Mather JP, Pan J, Paoni NF, Roy MA, Stewart TA, Novel isolated PRO polypeptide useful for treating Parkinson's disease, enterocolitis, Zollinger-Ellison syndrome, gastrointestinal ulceration, Alzheimer's disease, amyotrophic lateral sclerosis.

Example 36; SEQ ID NO 229; 478pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a cell expressing a PRO protein and for modulating at least one biological activity of a cell. PRO polypeptides are useful for detecting other PRO polypeptides in a sample and for linking a bioactive molecule to a cell expressing a PRO polypeptide. The PRO polypeptide antibodies are useful for modulating the biological activity of a cell expressing PRO polypeptides. The PRO polypeptide antibodies are useful for modulating the biological activity of a cell expressing PRO polypeptides. The PRO polypeptides or

registration of endothelial cells, modulating the proliferation of stimulated T-lymphocytes, enhancing the survival or proliferation of endothelial cells, modulating proliferation of cells, modulating proliferation of cells, modulating proliferation and/or receiptor cells, inducing c-fos in endothelial cells, modulating glucose or FFA uptake, inducing c-fos in endothelial cells, modulating glucose or FFA uptake, inducing c-fos in endothelial cells, modulating glucose or FFA uptake, inducing c-fos in endothelial detecting or treating cardiac insufficiency disorders, wounds, cancerous cumours, retinal disorders or injuries (e.g. loss of sight due to retinitis pigmentosum), obesity, diabetes, hyperinsulinaemia, or bone or cartilage disorders (e.g. sports injuries or arthritis) in mammals. PRO polypeptides and their portions affect the expression of genes which have a role in cell death. The polymucleotides are useful in molecular biology including uses as hybridisation probes or companies, in chromosome and gene mapping, in the generation of antisense RNA and DNA, for preparing PRO polypeptides, for generating transgenic cond by, for preparing PRO polypeptides, for generating transgenic and DNA, for preparing PRO polypeptides, as probes and for the generating of therapeutically useful reagents, as probes and for the generating are useful sampled in the development and generation are useful as molecular marker for protein electrophoresis proteins are useful for tissue typing; PRO antibodies are useful for the PRO polypeptide (antagonists). The polymucleotides and proteins are useful for tissue typing. PRO antibodies are useful for the pRO polypeptide (antagonists) or prevent the effect of immunohistochemical staining and/or assays for PRO e.g. detecting its expression in specific cells, tissues or serum and for affinity and produce presented is a PRR primer which was used to amplify a PRO polymerice. polynucleotides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. These are useful for stimulating hypertrophy of neonatal heart, inhibiting vascular endothelial growth factor (VEGF)-stimulated

Novel isolated PRO polypeptides e.g. PRO245 and PRO1868, useful for treating e.g. Parkinson's disease, Alzheimer's disease, amyotrophic lateral sclerosis, cancer, neuropathies, diabetes and psoriasis.

Example 36; SEQ ID NO 229; 476pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides can the mucleic acid encoding them. The polypeptides can be used to raise cantibodies that specifically bind to the PRO polypeptides can be useful continuing a bioactive molecule to a call expressing a PRO polypeptides are useful for detecting other PRO polypeptides in a sample and for linking a bioactive molecule to a call expressing a PRO polypeptides are useful for detecting other PRO polypeptides. The PRO polypeptides or polypeptide are useful for modulating the biological activity of a call expressing as PRO polypeptides or polypeptides are useful for modulating the biological activity of a call expressing PRO polypeptides. The PRO polypeptides or polymentication for a call expressing the properties or polymucleotides are useful for modulating the proliferation of candential calls, modulating the proliferation of stimulated T-lymphocytes, enhancing the survival or proliferation of stimulated T-lymphocytes, enhancing the survival or proliferation of candential calls, inducing proliferation of stimulated T-lymphocytes, inputake, inducing c-fost in endothelial calls, modulating glucose or FFA uptake, inducing proliferation of calls, modulating glucose or FFA uptake, inducing proliferation of calls, modulating glucose or FFA uptake, inducing proliferation of cardiac insufficiency disorders, womans, or bone or cartilage disorders, womans, or bone or cartilage disorders, possibly dispersed by modulating properties in molecular properties and thair portions affect the arthritis pigmentosum), obesity diabetes, hyperinsulinamia, or bone or cartilage disorders or carthritis or consone and genes which have a role in call dearth. The polymocal and planty to isolate the full-length PRO cDNA or to isolate other constants in molecular biology including uses as hybridisation care useful is molecular marker for protein electronaly of therapeutically useful reagents, as probes and for the generic analysis of individuals with generic disorders of artisp

                                                                                                                                                                                                                                                                                                                                  24-NOV-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       13-OCT-1
 ö
               antibodies are useful in diagnostic assays for PRO e.g. detecting its expression in specific cells, tissues or serum and for affinity urification of PRO from recombinant cell culture or natural sources. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequence presented is a PCR primer which was used to amplify a PRO polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               tissue typing; immunohistochemical staining; gene therapy; neonatal heart; vascular endothelial growth factor; VEGF; proliferation; endothelial cell; stimulated T-lymphocyte; retinal neuron; rod photoreceptor cell; c-fos; glucose; FFA; chondrocyte; cardiac insufficiency disorder; wound; cancer; tumour; retinal disorder; retinitis pigmentosum; obesity; diabete; hyperinsulinaemia; hypoinsulinaemia; hypoinsulinaemia; oradiant; vulnerary; cytostatic; ophthalmological; osteopathic; antiarthritic; anorectic.

contribudies that specifically bind to the PRO puppetides can be used to raise antibodies that specifically bind to the PRO polypeptides, for linking a can biological activity of a cell. PRO polypeptides for linking a can biological activity of a cell. PRO polypeptides are useful bioactive molecule to a cell expressing a PRO polypeptide. The RO polypeptides are useful for modulating the biological activity of bioactive molecule to a cell expressing a PRO polypeptide. The PRO polypeptides are useful for modulating the biological activity of placeture molecule are useful for modulating the biological activity of placeture. These are useful for simulating hypertrophy of meomatal bioacative molecules are useful for simulating hypertrophy of meomatal conformation of endothelial cells, modulating the proliferation of placeture are useful for simulating propertrophy of meomatal neart, inhibiting vascular endothelial cells, inducing c-fos in endothelial cells, modulating inducing c-fos in endothelial cells, modulating induced or FRA uptake, inducing c-fos in endothelial cells, modulating proliferation of the central nearnon of chondrocytes. In particular, these are useful for cetinal nearnon of chondrocytes, in particular, these are useful for cetinal nearnon of chondrocytes. In particular, these are useful for cetinitis pigmentosum), obesity, diabetes, hyperinsulinaemia, chors or reatinged cardiac insufficienty disorders (e.g. sports injuries or arthritis) in mammals. PRO polypeptides and their portions affect the expression of genes which have a role in cell death. The polymocell conductions are useful in molecular biology including uses as hybridisation probes for cDNA ibrary to isolate the full-length pro conducts and the development and conductions and gene mapping, in the generation of antisons conducting of therapeutically useful reagents, or special sarbing of therapeutically useful reagents, or processing the protein and entities are useful and propertied charagonists for genetic analysis of individuals with g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

(GETH) GENENTECH INC.

Ferrara N; 1 ME, Goddard A; Kljavin IJ; Tumas D; Ashkenazi A, Botstein D, Desnoyers L, Eaton DL, Filvaroff E, Fong S, Gao W, Gerber H, Gerritsen Godowski PJ, Grimaldi JC, Gurney AL, Hillan KJ, Mather JP, Pan J, Paoni NP, Roy MA, Stewart TA, Wood WI: Williams PM,

WPI; 2003-743881/70.

New secreted transmembrane PRO polypeptides and nucleic acids encoding the polypeptides, useful in gene therapy, in identifying chromosomes, as chromosome markers, in generating probes and in tissue typing.

Example 36; SEQ ID NO 229; 487pp; English.

and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide for linking a biactorie molecule to a cell expressing a PRO polypeptide. for linking at least one biological activity of a cell. PRO polypeptides are useful to detecting other PRO polypeptides in a sample and for linking a bioactive molecule to a cell expressing a PRO polypeptide. The PRO polypeptide antibodies are useful for modulating the biological activity of a cell expressing PRO polypeptide or polypeptide antibodies are useful for modulating the biological activity of a cell expressing PRO polypeptide or polymetrophy of neonatal chart, inhibiting vascular endothelial growth factor (VEGP)-stimulated proliferation of endothelial cells, modulating the proliferation of crimulated T-lymphocytes, enhancing the survival or proliferation of retinal neurons or rod photoreceptor cells, inducing c-fos in endothelial cells, modulating proliferation and/or re The invention discloses isolated PRO secreted/transmembrane polypeptides

```
cumoniary are treating cardiac insufficiency disorders, wounds, cancerous detecting or treating cardiac insufficiency disorders, wounds, cancerous cumours, retinal disorders or injuries (e.g. 10ss of sight due to retinitis pigmentosum), obesity, diabetee, hyperingulinaemia, hyperingulinaemia, or bone or cartilage disorders (e.g. sports injuries or arthritis) in mammals. PRO polypeptides and their portions affect the expression of genes which have a note in cell death. The polymuclectides are useful in molecular biology including uses as hybridisation probes of or cDNA library to isolate the full-length RNO cDNA or to isolate other CDNAs, in chromosome and gene mapping, in the generation of antisense RNA and DNA, for preparing PRO polypeptides, for generating transgenic animals or knockout animals which are useful in the development and screening of therapeutically useful reagents, as probes and for the corrections are useful as molecular marker for protein electrophoresis purposes, as therapeutic agents, for screening compounds to identify those there is the minimal which protein and for offromosome identification. The proteins are useful as molecular marker for protein electrophoresis or purposes, as therapeutic agents, for screening compounds to identify to those that minim the RNO polypeptide (ancagonists). The polymucleotides and proteins are useful for tissue typing. PRO antibodies are useful for antibodies are useful for managonists). The polymucleotides and proteins are useful in diagnostic assays for PRO e.g. detecting its expression in specific cells, tissues or serum and for affinity continued or matural sources. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequence presented is a PCR primer which was used to amplify a PRO polypurcleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

Novel isolated native PRO polypeptide useful for tissue typing, modulating biological activity of cell, as molecular weight markers in protein electrophoresis, for treating enterocolitis, Zollinger-Ellison syndrome.

Example 36; SEQ ID NO 229; 474pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nurolic acid encoding them. The polypeptides can be used to raise and the nurolic acid encoding them. The polypeptide to raise antibodies that specifically bind to the PRO polypeptide. For linking a control system wolecule to a cell systessing a PRO polypeptide. The PRO polypeptide are useful for a cell systessing a PRO polypeptide on the properties of the prop

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides con the used to raise and the nucleic acid encoding them. The polypeptide for linking a carticular polypeptide of the used to raise the least one biological activity of a cell. PRO polypeptide. The PRO polypeptide activity of a cell expressing a PRO polypeptide. The PRO polypeptide activity of a cell perpension and for linking a to load tive molecule to a cell expressing a PRO polypeptides. The PRO polypeptide activity of polypeptide antibodies are useful for modulating the biological activity of polypeptide antibodies are useful for modulating the biological activity of polypeptide activity of a cell expressing PRO polypeptides. The PRO polypeptides of collpany of collpa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; PCR; primer; ss; PRO; secreted; transmembrane; therapeutic;

Novel isolated native PRO polypeptide useful for tissue typing, modulating biological activity of cell, as molecular weight markers in protein electrophoresis, for treating enterocolitis, Zollinger-Ellison

Example 36; SEQ ID NO 229; 472pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bloactive molecule to a cell expressing a PRO protein and for modulating a to reast one biological activity of a cell. PRO polypeptides are useful compactive molecule to a cell expressing a PRO polypeptide. The PRO polypeptide are useful compactive molecule to a cell expressing a PRO polypeptide. The PRO polypeptide antibodies are useful for modulating the biological activity of a cell expressing a PRO polypeptides or polypeptide antibodies are useful for modulating the biological activity of a cell expressing a pRO polypeptides or coll expressing PRO polypeptides or polymucleotides are useful for stimulating hypertrophy of neonatal colliferation of the factor (VEGP) stimulated colliferation of endothelial growth factor (VEGP) stimulated colliferation of conditions or red photoreceptor cells, inducing colliferation of chondrocytes, enhancing the survival or proliferation of conditions or cells, inducing colliferation of chondrocytes, inducing proliferation and/or reciplementation of chondrocytes, inducing proliferation and conditions cells, modulating proliferation of chondrocytes, inducing proliferation of chondrocytes, inducing colliferation of chondrocytes, inducing colliferation of chondrocytes, inducing colliferation of chondrocytes, inducing colliferation of chondrocytes, inducing proliferation of chondrocytes, inducing colliferation colliferation of chondrocytes, chondrocytes, chondrocytes, chondr

cc arthritis) in mammals. PRO polypeptides and their portions affect the expression of genes which have a role in cell death. The polynucleotides care useful in molecular biology including uses as hybridisation probes for cDNA library to isolate the full-length PRO cDNA or to isolate other contained to preparing PRO polypeptides, for generation of antisense RNA and DNA, for preparing PRO polypeptides, for generation of antisense RNA and DNA, for preparing languagemic canimals or knockout animals which are useful in the development and screening of therapeutically useful reagents, as probes and for the crecombinantly expressing the protein and for chromosome identification. The proteins are useful as molecular marker for protein electrophoreas purposes, as therapeutic agents, for screening compounds to identify the proteins are useful as molecular marker for protein electrophoreas purposes, as therapeutic agents, for screening compounds to identify the PRO polypeptide (antagonists). The polynuciectides and proteins are useful for tissue typing PRO antibodies are useful for commission-marker and/or assay of sample fluids. Anti-PRO antibodies are useful in diagnostic assays for PRO e.g. detecting its expression in specific cells, tissues or serum and for affinity corresponded to the sequence presented is a PCR primer which was used to explicate amplify a PRO polymucleotide of the invention. Sequence 18 BP; 3 A; 5 C; 7 G; 3 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ò
                                                            carboxypeptidase G2 (CPG2). The modified enzyme can result in CPG2 proteins that are substantially non-immunogenic or less immunogenic than any on-modified CPG2 having essentially the same biological specificity when used in vivo, and comprising specific amino acid residues having alterations compared with the non-modified parochial enzyme. The alterations cause a reduction or an elimination of one or more of T-cell captops sequences, which act in the parental enzyme as MHC class II binding ligands and stimulate T-cells. The modified CPG2 enzyme and the CPG2 proteins have immunostimulant activity and may be used in enzyme therapy. The modified CPG2 enzyme may be used to induce an immune response in a human host, or as a therapeutic entity such as the gene directed enzyme prodrug strategy. The peptide is useful for the manufacture of a modified CPG2 enzyme having substantially no or less immunogenicity than any non-modified parental enzyme when used in vivo, and for vaccination of patients to reduce immunogenicity to CPG2 in vivo.

This polymodelectide sequence represents a mutagenic oligonuclectide used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New modified bacterial enzyme carboxypeptidase G2 (CPG2) having substantially non-immunogenic or less immunogenic than any non-modified CPG2, useful for inducing an immune response in a human host.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            directed enzyme prodrug strategy; vaccine; enzyme; EC 3.4.17.11;

The invention relates to a novel modified bacterial enzyme car result in CPG2 carboxypeptidase G2 (CPG2). The modified enzyme can result in CPG2 proteins that are substantially non-immunogenic or less immunogenic than any non-modified CPG2 having essentially the same biological specificity when used in vivo, and comprising specific amino acid residues having alterations cause a reduction or an elimination of one or more of T-cell epitope sequences, which act in the parental enzyme as MHC class II epitope sequences, which act in the parental enzyme as MHC class II epitope sequences, which act in the parental enzyme as MHC class II epitope sequences, which act in the parental enzyme as II epitope sequences, which act in the parental enzyme as MHC class II epitope sequences, which act in the parental enzyme as MHC class II epitope sequences, which act in the parental enzyme as II enzyme therapy. The modified CPG2 enzyme may be used in enzyme therapy. The modified CPG2 enzyme having substantially no or less immunogenicity than any non-modified parental enzyme when used in vivo, and for vaccination of patients to reduce immunogenicity to CPG2 in vivo, and for vaccination of patients to reduce immunogenicity to CPG2 in vivo.

This polymucleotide sequence represents a mutagenic objectide used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; PCR; primer; ss; PRO; secreted; transmembrane; therapeutic; tissue typing; immunohistochemical staining; gene therapy; neconatal heart; vascular endothelial growth factor; VEGF; proliferation; endothelial cell; stimulated T-lymphocyte; retinal neuron; rod photoreceptor cell; c-fos; glucose; FFA; chondrocyte; cardiac insufficiency disorder; wound; cancer; tumour; retinal disorder; retinitis pigmentosum; obesity; diabete; hyperinaulineamia; hypoinsulinaemia; bone disorder; cartilage disorder; sport injury; arthritis; cardiant; vulnerary; cytostatic; ophthalmological; osteopathic; antiarthritic; anorectic.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide. for linking a caribodies that specifically bind to the PRO polypeptide. for linking a transmission molecule to a cell expressing a PRO polypeptide. The PRO polypeptide is to reach a cell expressing a PRO polypeptide in the PRO polypeptide antibodies are useful for modulating the biological activity of a cell. PRO polypeptide on the properties of a cell expressing PRO polypeptides. The PRO polypeptides or polypeptide antibodies are useful for modulating the biological activity of a cell expressing PRO polypeptides. The PRO polypeptides or polymolectides are useful for modulating operation of properties of a cell expressing properties of the properties of polymolectides are useful for setuminating propertopy of meanaral chart. inhibiting varcular endothelial growth factor (VEGP) estimulated proliferation of condorcoves. In particular, inducing creating cardiacling glucose or FRA uptack, inducing proliferation of chondrocyes. Cells, modulating proliferation of chondrocyes. In particular, these are useful for cells, modulating proliferation of chondrocyes. In particular, these are useful for detecting cardiac insufficiency disorders, wounds, cancerous tumours, retinal disorders or injuries (e.g. loss of sight due to continuing or treating cardiac insufficiency disorders, wounds, cancerous tumours, retinal disorders or injuries (e.g. sports injuries or arthritis) in mammals. PRO polypeptides and their portions affect the arthritis in mammals, proposed or cartilage disorders and phylication of sense which have a rote in cell for coNA library to isolate the full-inger Research of antisense RNA continuing or knockout animals which are useful in the development and continuing of therapeutically useful responders as probes and for the properties of individuals with generic disorders as well as molecular manary crecentin New isolated PRO polypeptides e.g. PRO245 and PRO1868, useful for treating e.g. Parkinson's disease, Alzheimer's disease, amyotrophic lateral sclerosis, cancer, neuropathies, diabetes and psoriasis. The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a cell expressing a PRO protein and for modulating at least one biological activity of a cell. PRO polypeptides are useful for detecting other PRO polypeptides in a sample and for linking a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated PRO polypeptides e.g. PRO211, PRO217 and PRO230, useful for treating Parkinson's disease, Alzheimer's disease, amyotropic lateral sclerosis, cancer, neuropathies and psoriasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             , Botstein D, Desnoyers L, Eaton DL, Ferrara N; , Fong S, Gao W, Gerber H, Gerritsen ME, Goddard A; Grimaldi JC, Gurney AL, Hillan KJ, Kljavin IJ; Pan J, Paoni NF, Roy MA, Stewart TA, Tumas D; wood WI;

```
bioactive molecule to a cell expressing a PRO polypeptide. The PRO polypeptide are useful as remained for modulating the biological activity of a cell expressing PRO polypeptides. The PRO polypeptides or cell expressing PRO polypeptides. The PRO polypeptides or polymucleotides are useful for ethmilating hypertrophy of meomatal heart, inhibiting vascular endethelial growth factor (VGGP)-etimulated colls. These are useful for ethmilating propertrophy of neomatal heart, inhibiting vascular endethelial cells, modulating the proliferation of crimulated cells, modulating the proliferation of crimulated cells, modulating the proliferation of crimulated reliance. The second of the condrocytes. In particular, these are useful for cells, modulating quicose or PRA witake, inducing proliferation of chondrocytes. In particular, these are useful for detecting or treating cardiac innelficiency disorders, wounds, cancerous tumours, retinal disorders or injuries (e.g. loss of sight due to rathitials) in mammals. PRO polypeptides and thair portions affect the arthitial in molecular biology including uses as hybridisation probes or carthitials in molecular biology including uses as hybridisation probes or constant of an endomental process and gene wasping, in the generation of antisense RNA and DNA, for preparing RNO polypeptides, for generating transgenic and surface or commands or knockout animals which are useful in the development and screening of therapeutically useful reagents, as probes and for the genetic analysis of individuals with genetic disorders as well as for creening of therapeutically useful reagents, as probes and for the proteins are useful in diagnostic assay of sample fluids. Anti-PRO these that mimic the PRO polypeptide (agonists) or prevent the effect of the PRO polypeptide (agonists) or prevent the effect of the PRO polypeptide (agonists) or prevent the effect of the PRO polypeptide (agonists) or prevent the PRO polypeptide call in a sequence presented in specific cells, tissues popularic assay of sample f

Novel isolated native PRO polypeptide useful for treating Parkinson's disease, enterocolitis, Zollinger-Ellison syndrome gastrointestinal ulceration, Alzheimer's disease, amyotrophic lateral sclerosis, Usher syndrome.

Example 36; SEQ ID NO 229; 471pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise and the nucleic acid encoding them. The polypeptides can be used to raise cation the propertied of the PRO polypeptide, for linking a bloactive molecule to a cell expressing a PRO polypeptides are useful for detecting other PRO polypeptides are useful for detecting other pRO polypeptides are useful for modulating the biological activity of a cell expressing PRO polypeptides. The PRO polypeptides or polypeptide antibodies are useful for modulating the biological activity of a cell expressing PRO polypeptides. The PRO polypeptides or coll expressing PRO polypeptides or collection of collection of endothalial cells, modulating the proliferation of collection of endothalial cells, modulating the proliferation of collection of endothalial cells, modulating proliferation of collecting or rod photoreceptor cells, inducing proliferation and/or recollecting or treating cardiac innegration of strainal neurons or rod photoreceptor cells, inducing proliferation of collecting or treating cardiac innegration of collecting or treating cardiac innegration of collecting or treating cardiac innegration of strainal disorders or injuries (e.g. ioso of sight due to collecting or treating cardiac innegration or collecting or collecting or collecting cardiac innegration or collecting cardiac innegration or collecting and their portions affect the collecting or preparing PRO polypeptides and their portions affect the collecting or collecting properties and their portions of antisense RNA and bNA, for preparing PRO polypeptides, for generating transgenic combasion of generic analysis of individuals with generation of combasion. The proteins are useful in the development and gene mapping, in the generation of combas

```
ö
purposes, as therapeutic agents, for screening compounds to identify those that mimic the PRO polypeptide (agonists) or prevent the effect of the PRO polypeptide (antagonists). The polynucleotides and proteins are useful for tissue typing. PRO antibodies are useful for immunobistochemical staining and/or assay of sample fluids. Anti-PRO antibodies are useful in diagnostic assays for PRO e.g. detecting its expression in specific cells, tissues or serum and for affinity purification of PRO from recombinant cell culture or natural sources. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequence presented is a PCR primer which was used to amplify a PRO polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; PRO; primer; ss; secreted polypeptide; transmembrane polypeptide; pathological disorder; cardiac insufficiency disorder; protein secretion; pancreas; diabetes; gastrointestinal mucosal mucosal lesion; psoriasis; skin disease; keratinocyte differentiation; epithelial cancer; tumour; lung squamous cell carcinoma; epidermoid carcinoma; vulva; glioma; PCR; cytostatic; cardiant; endocrine; antidiabetic; gastrointestinal;

Also polypeptides and polynucleotides can be used in treating pathological disorders and tumours, in therapeutic treatment of cardiac insufficiency disorders and in therapeutic treatment of disorders involving protein secretion by the pancreas, including diabetes. They can also be used in treating disorders associated with the preservation and maintenance of gastrointestinal mucosa and the repair of acute and chronic mucosal lesions, and skin diseases associated with abnormal keratinocyte differentiation (e.g., psoriases, epithelial cancers such as lung squamous cell carcinoma, epidermoid carcinoma of the vulva and gliomas). The sequences can be used as molecular markers for protein electrophoresis purposes and can be utilised in protein-protein binding assays, biochemical screening assays, immunoassays and cell-based assays. polynucleotide of the invention

New isolated nucleic acid encoding a PRO polypeptide, e.g. PRO245 or PRO1868, useful in molecular biology, chromosome and gene mapping, in generating antisense RNA and DNA, and in gene therapy.

Example 37; Page 102; 474pp; English.

The present invention relates to the isolation of novel human secreted and transmembrane proteins (PRO polypeptides), and the polynucleotide

```
ö
sequences encoding them. The polynucleotide sequences are useful in molecular biology, as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and DNA, and in gene therapy. The polynucleotide sequences may also be used in preparing PRO polypeptides by recombinant techniques, and in generating either transgenic animals or knock-out animals which, in turn, are useful in the development and screening of therapeutically useful reagents. The PRO polypeptides or their antibodies are useful in preparing a medicament for treating condition responsive to the polypeptide or antibody, such as cancer, allahelmer's disease or ischaemia, and in various diagnostic assays. The present sequence represents a PCR primer used in the examples of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; PCR; primer; ss; PRO; secreted; transmembrane; therapeutic; tissue typing; immunohistochemical staining; gene therapy; neonatal heart; vascular endothelial growth factor; VEGF; proliferation; endothelial cell; stimulated T-lymphocyte; retinal neuron; rod photoreceptor cell; c-fos; glucose; FFA; chondrocyte; cardiac insufficiency disorder; wound; cancer; tumour; retinal disorder; retinitis pigmentosum; obesity; diabete; hyperinaulinaemia; hypoinsulinaemia; bone disorder; cartilage disorder; sport injury; arthritis; cardiant; vulnerary; cytostatic; ophthalmological; osteopathic; antiarthritic; anorectic.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide. For linking a card the modified to a cell expressing a PRO polypeptide. The PRO polypeptide is a sample and for modilating a bloactive molecule to a cell expressing a PRO polypeptides or useful for detecting other PRO polypeptides in a sample and for linking a bloactive molecule to a cell expressing a PRO polypeptides or linking a conscience of a cell expressing PRO polypeptides. The PRO polypeptides or polymolectides are useful for modulating the biological activity of control procedures. These are useful for modulating the proliferation of polymolectides are useful for seimulating phycetrophy of meonatal control procedures. The propose of PRO polypeptides or training a glucose or FRA uptack, inducing proliferation of chondrocytes. Entantacing the proliferation of chondrocytes. In particular, these are useful for ceils, modulating glucose or FRA uptack, inducing proliferation of chondrocytes. In particular, these are useful for ceils, modulating glucose or FRA uptack, inducing proliferation and or the proliferation of chondrocytes. In particular, these are useful for ceils, modulating plucose or FRO uptacks, inducing proliferation of chondrocytes or injuries (e.g. ions of sight due to ceils, modulating plucose or FRO uptacks or injuries (e.g. sport or ceils, modulating plucose or farminase (e.g. sport or ceins of genes which have a role in cell or cord library to isolate the fer ull-length RRO colypeptides and their portions affect the creaming of genes which have a role in cell for cord library to isolate the fer ull-length RRO colypeptides or control or solate or the control or solate the coll or cord library to isolate the fer ull-length RRO polypeptide, or cord library to isolate the fer ull coll or cord library to isolate the fer ull coll or cord library to solate the properties of solate the PRO polypep Novel isolated native PRO polypeptide useful for tissue typing, modulating biological activity of cell, as molecular weight markers in protein electrophoresis, for treating enterocolitis, Zollinger-Ellison Gaps Botstein D, Desnoyers L, Baton DL, Ferrara N; Fong S, Gao W, Gerber H, Gerriteen ME, Goddard A; Grimaldi JC, Gurney AL, Hillan KJ, Kljavin IJ; an J, Paoni NF, Roy MA, Stewart TA, Tumas D; ;; 0 0.4%; Score 14.4; DB 1; Length 18; 93.8%; Pred. ```
The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a cell expressing a PRO polypeptide, for linking a test one biological activity of a cell. PRO protein and for modulating at least one biological activity of a cell. PRO polypeptides are useful for detecting other PRO polypeptides in a sample and for linking a bioactive molecule to a cell expressing a PRO polypeptide. The PRO polypeptide antibodies are useful for modulating the biological activity of a cell expressing PRO polypeptides. The PRO polypeptides or polypeptides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. These are useful for stimulating hypertrophy of meonatal heart, inhibiting vascular endothelial growth factor (VEGF)-stimulated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New nucleic acid encoding a PRO polypeptide, for producing a recombinant PRO polypeptide and for treating e.g. cancer, infertility, kidney disorders, and cardiac disfunctions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Example 36; SEQ ID NO 229; 473pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              25-NOV-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            04 - JUN-
           proliferation of endothelial cells, modulating the proliferation of etimulated T-lymphocytes, enhancing the survival or proliferation of cetimal neurons or rod photoreceptor cells, inducing c-fos in endothelial cells, modulating glucose or FFA uptake, inducing proliferation and/or redifferentiation of chondrocytes. In particular, these are useful for detecting or treating cardiac insufficiency disorders, wounds, cancerous tumours, retinal disorders or injuries (e.g. loss of sight due to retinitis pigmentosum), obesity, diabetes, hyperinsulinaemia, or bone or cartilage disorders (e.g. sports injuries or arthritis) in mammals. PRO polypeptides and their portions affect the expression of genes which have a role in cell death. The polymucleotides are useful in molecular biology including uses as hybridisation probes for cDNAs, in chromosome and gene mapping, in the generation of antisense RNA and DNA, for preparing PRO polypeptides, for generating transgenic animals which are useful in the development and screening of therapeutically useful reagents, as probes and for the genetic analysis of individuals with genetic disorders as well as for complainantly expressing the protein and for chromosome identification. The proteins are useful as molecular marker for protein electrophoresis purposes, as therapeutic agents, for screening compounds to identify the protein are useful as molecular marker for protein electrophoresis purposes, as therapeutic agents, for screening compounds to identify the PRO polypeptide (angonists). The polymucleotides and proteins are useful for tissue typing. PRO antibodies are useful for tissue typing. PRO antibodies are useful for useful for tissue typing. PRO antibodies ample fluids. Anti-PRO antibodies and protein are useful for tissue typing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                     antibodies are useful in diagnostic assays for PRO e.g. detecting its expression in specific cells, tissues or serum and for affinity purification of PRO from recombinant cell culture or natural sources. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequence presented is a PCR primer which was used to amplify a PRO polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               tissue typing; immunohistochemical staining; gene therapy; neonatal heart; vascular endothelial growth factor; VEGF; proliferation; endothelial cell; stimulated T-lymphocyte; retinal neuron; rod photoreceptor cell; c-fos; glucose; FFA; chondrocyte; cardiac insufficiency disorder; wound; cancer; tumour; retinal disorder; retinitis pigmentosum; obesity; diabete; hyperinsulinaemia; hypoinsulinaemia; hypoinsulinaemia; one disorder; cartilage disorder; sport injury; arthritis; cardiant; vulnerary; cytostatic; ophthalmological; osteopathic; antiarthritic; anorectic.

New PRO nucleic acid, useful for manufacturing a medicament for diagnosing or treating tumor or for tissue typing. WPI; 2004-020353/02.

Example 36; SEQ ID NO 229; 480pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the mucleic acid encoding them. The polypeptides contribution and the mucleic acid encoding them. The polypeptides, for linking a bloative molecule to a cell expressing a PRO polypeptide, for linking a bloative molecule to a cell expressing a PRO polypeptides are useful activity of a cell. PRO polypeptides are useful other PRO polypeptides in a sample and for inking a bloactive molecule to a cell expressing a PRO polypeptides are useful other PRO polypeptides. The PRO polypeptide arthodises are useful as pharmaceuticals, diagnostics, biosensors or polymucleotides are useful for stimulating the biological activity of a cell expressing as pharmaceuticals, diagnostics, biosensors or polymucleotides are useful for stimulating hypertrophy of neonatal heart, inhibiting vascular endothalial cells, modulating the proliferation of proliferation of endothalial cells, modulating the proliferation of stimulated Trymphosytes, enhancing the survival or proliferation of chondrocytes, enhancing the survival or proliferation of chondrocytes, enhancing the survival or proliferation of chondrocytes, enhancing the proliferation of chondrocytes, enhancing proliferation of chondrocytes, enhancing proliferation of stimulated to treating or treating cort reading carder in particular, these are useful for cells, modulating glucose or FFA uprake, inducing proliferation and/or recent cells, modulating of processor or injuries (e.g. loss of sight due to architis pigmentosum), obseity, diabetes, hyperinsulinaemia, or bone or cartilage disorders (e.g. sports injuries or retinitis pigmentosum), obseity, diabetes, hyperinsulinaemia, or bone or cartilage disorders (e.g. sports injuries or construction in molecular biology including uses as hybridiate one cartilage disorders (e.g. sports injuries or construction in molecular biology including uses as hybridiates on the construction of encoded and public proparating PRO polypeptides, for generating transgenic animals or

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic arid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide. For linking a cariobdise that specifically bind to the PRO polypeptide. For linking a to discative molecule to a cell syrpessing a PRO polypeptide. The PRO polypeptides are useful for modulating the biological activity of a cell. PRO polypeptides are useful for modulating the biological activity of a cell. PRO polypeptides on the processing PRO polypeptides. The PRO polypeptides on the processing PRO polypeptides. The PRO polypeptides on the processing PRO polypeptides in a sample and for individual process. These are useful for modulating propertion, of conducting the proliferation of polymeropy of meancal care that individual spluces or FAY uptake, inducing proliferation of conducytes, enhancing the proliferation of conducytes, enhancing the proliferation of conducytes, enhancing the proliferation of conducytes, inducing proliferation of conducytes, enhancing the proliferation of conducytes, inducing proliferation of conducytes, inducing proliferation of conducytes or individual proliferation of denancy or cartiling ediocyters (e.g. sports individual proliferation of solate the proliferation of solate the conduction of antibution of solate the bill-length PRO toby pertices of conduction properties of conduction of solate the full-length PRO toby antibution of therapeutically useful reagents as probes and for the protein and proliferation of the protein and proliferation of the properties of individuals with generation of solate the PRO polypeptide, conducy in solate the PRO poly
New nucleic acids encoding polypeptides designated PRO have sequence identity to various secreted proteins and transmembrane proteins and are useful in molecular techniques and as therapeutic agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; PCR; primer; ss; PRO; secreted; transmembrane; therapeutic;

WPI; 2004-020440/02.

Isolated secreted and transmembrane PRO nucleic acids and the proteins they encode, e.g. PRO245, PRO269 and PRO1868, useful for preventing, diagnosing and treating e.g. disorders relating to blood coagulation.

Example 36; SEQ ID NO 229; 1pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a cell expressing a PRO protein and for modulating at least one biological activity of a cell. PRO polypeptides are useful for detering other PRO polypeptides in a sample and for linking a collypeptide antibodies are useful for modulating the biological activity of a cell expressing PRO polypeptides or the PRO polypeptides are useful for modulating the biological activity of a cell expressing PRO polypeptides or the PRO polypeptides are useful for stimulating the biological activity of a cell expressing PRO polypeptides or the PRO polypeptides or proliferation of endothelial cells, modulating the proliferation of stimulated T-lymphocytes, enhancing the survival or proliferation of cells, modulating proliferation of cells, inducing collecting acadiac insufficiency disorders, wounds, cancerous tumours, retinal disorders or injuries (e.g. loss of sight due to thypoinsulinaemia, or bone or cartilage disorders (e.g. sports injuries or

WPI; 2004-021580/02.

cc arthritis) in mammals. PRO polypeptides and their portions affect the expression of genes which have a role in cell death. The polynucleotides care useful in molecular biology including uses as hybridisation probes for cDNA library to isolate the full-length PRO cDNA or to isolate other cDNAs, in chromosome and gene mapping, in the generation of antisense RNA cand DNA, for preparing PRO polypeptides, for generation of antisense RNA cand DNA, for preparing PRO polypeptides, for generation of antisense RNA canimals or knockout animals which are useful in the development and screening of therapeutically useful reagents, as probes and for the crecombinantly expressing the protein and for chromosome identification. The proteins are useful as molecular marker for protein electrophoresis purposes, as therapeutic agents, for screening compounds to identify those that mimic the PRO polypeptide (agonists) or prevent the effect of the PRO polypeptide (antagonists). The polynucleotides and proteins are useful in diagnostic assays for PRO e.g. detecting its expression in specific cells, tissues or serum and for affinity cantibodies are useful in diagnostic assays for PRO e.g. detecting its expression in specific cells, tissues or serum and for affinity or profice may also be used in gene therapy, particularly for replacing a defective gene. The sequence presented is a PCR primer which was used to amplify a PRO polymucleotide of the invention. Sequence 18 BP; 3 A; 5 C; 7 G; 3 T; 0 U; 0 Other;

contribudies that specifically bind to the RPO bypeptide, for linking a chitchodies that specifically bind to the RPO polypeptides can be used to raise and the nucleic acid encoding them. The polypeptides can be used to raise bioactive modecule to a cell expressing a RPO polypeptides. The RPO polypeptides in a sample and for linking a for detecting other RPO polypeptides in a sample and for linking a bioactive molecule to a cell expressing a RPO polypeptide. The PRO polypeptides are useful for modulating the biological activity of a cell expressing a RPO polypeptides. The PRO polypeptides or polymorlectides are useful for simulating hypeptide or control for simulating hypertcophy of mematal bioactors. These are useful for simulating hypertcophy of mematal bioactors. These are useful for simulating propertcophy of mematal control feration of endothelial cells, modulating proliferation of condroverse or FA uptake, inducing or proliferation of condroverse in particular, these are useful for citimal neurons or rod photoreceptor cells, inducing proliferation and/or rectinal neurons or rod photoreceptor cells, inducing proliferation and/or redetering or treating cardiac insufficiently, these are useful for chemory testinal disorders or injurias (e.g. loss of sight due to certinitis pigmentosum), obesity, diabetes, hyperinsulinsemia, or control of genes which have a role in cell death. The polymorlectides are useful in molecular biology including uses as hybridisation probes for cDNA inbrary to isolate the full-length RPO cDNA or to isolate other containing of therapeutically useful respension of antisense RNA care useful in molecular biology including uses as hybridisation of antisense containally expression and gene mapping, in the generation of antisense containing of therapeutically useful respension of genes which have a role in cell death. The polymorphic combinantly expressing the protein and for cure or carting of therapeutically useful respense, as probes and for the growing and properse, as therapeutically u The invention discloses isolated PRO secreted/transmembrane polypeptides New PRO polypeptide for preparing a medicament for treating a condition that is responsive to the PRO polypeptide or anti-PRO antibody, e.g. inflammatory diseases, cancer or acquired immunodeficiency syndrome. Example 36; SEQ ID NO 229; 476pp; English

New isolated native PRO polypeptide useful for treating Parkinson's disease, enterocolitis, Zollinger-Ellison syndrome gastrointestinal ulceration, Alzheimer's disease, amyotrophic lateral sclerosis, or Usher

Example 36; SEQ ID NO 229; 469pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bloactive molecule to a cell expressing a PRO protein and for modulating at least one biological activity of a cell. PRO polypeptides are useful for detecting other PRO polypeptides in a sample and for modulating a bloactive molecule to a cell expressing a PRO polypeptide are useful to polypeptide antibodies are useful for modulating the biological activity of a cell expressing PRO polypeptides. The PRO polypeptide antibodies are useful for modulating the biological activity of a cell expressing PRO polypeptides. The PRO polypeptides or collocations are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. These are useful for stimulating hypertrophy of neonatal chart, inhibiting vascular endothelial growth factor (VEGF)-stimulated proliferation of endothelial cells, modulating the proliferation of endothelial cells, inducing c-fos in endothelial cells, modulating glucose or FRA uptake, inducing proliferation and/or redifferentiation of chondrocytes. In particular, these are useful for cifferential or cells, modulating proliferation and/or redifferentiation of chondrocytes. In particular, these are useful for

cc detecting or treating cardiac insufficiency disorders, wounds, cancerous tumours, retinal disorders or injuries (e.g. loss of sight due to retinitis pigmentosum), obesity, diabetes, hyperinsulinaemia, or bone or cartilage disorders (e.g. sports injuries or arbititis) in mammals. PRO polypeptides and their portions affect the expression of genes which have a role in cell death. The polymucleotides or are useful in molecular biology including uses as hybridisation probes or constant of genes which have a role in cell death. The polymucleotides or are useful in molecular biology including uses as hybridisation probes or constant of preparing PRO polypeptides. For generation of antisense RNA and DNA, for preparing PRO polypeptides, for generation of antisense RNA conformation of therapeutically useful reagents, as probes and for the screening of therapeutically useful reagents, as probes and for the combinantly expressing the protein and for chromosome identification. The proteins are useful as molecular marker for protein electrophoresis purposes, as therapeutic agents, for screening compounds to identify the proteins are useful as molecular marker for protein electrophoresis purposes, as therapeutic agents, for screening compounds to identify the proteins are useful and/or assay of sample fluids. Anti-protein electing its constitution for tissue typing. PRO antibodies are useful for chromosome identification of PRO form recombinant cell culture or natural sources. The profice may also be used in gene therapy, particularly for replacing a defective gene. The sequence presented is a PCR primer which was used to maplify a PRO polypurcleotide of the invention.

New secreted and transmembrane nucleic acids and polypeptides, designated as PRO, useful for treating inflammation, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, or

Example 36; SEQ ID NO 229; 473pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the mucleic acid enceding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide for linking a bloactive molecule to a cell expressing a PRO polypeptide. The PRO polypeptide in the properties of a cell expressing a PRO polypeptide in the PRO polypeptide antibodies are useful for modulating the biological activity of a cell expressing a PRO polypeptide in the PRO polypeptide antibodies are useful for modulating the biological activity of polypeptide antibodies are useful for modulating the biological activity of a cell expressing PRO polypeptides. The PRO polypeptides or polypeptide antibodies are useful for modulating the biological activity of a cell expressing PRO polypeptides. The PRO polypeptides or polymorlocides are useful for stimulating hypertrophy of neonatal bioreactors. These are useful for stimulating hypertrophy of neonatal proliferation of endothelial cells, modulating the proliferation of crimulate or rod phortoreceptor cells, inducing c-fos in endothelial cells modulating glucose or PRA uptake, inducing proliferation of crimulating glucose or PRA uptake, inducing proliferation and/or recills modulating glucose or PRA uptake, inducing proliferation and/or recills modulating of chondrocytes. In particular these are useful for retinalisemals, or bone or cartilage disorders, wounds, cancerous crimulates properson of genetical and plantary of socretical and plantary and plantary of socretical and plantary and p amplify a PRO polynucleotide of the invention.

New PRO nucleic acid, useful for manufacturing a medicament for diagnosing or treating tumor, for chromosome mapping or for tissue

Example 36; SEQ ID NO 229; 463pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bloactive molecule to a cell expressing a PRO protein and for modulating at least one biological activity of a cell. PRO polypeptides are useful for detecting other PRO polypeptides in a sample and for linking a bloactive molecule to a cell expressing a PRO polypeptide are useful for modulating the biological activity of a cell expressing PRO polypeptides. The PRO polypeptide artibodies are useful for modulating the biological activity of a cell expressing PRO polypeptides. The PRO polypeptides or polymedicotides are useful for stimulating hypertrophy of neonatal chart, inhibiting vascular endothelial growth factor (VEGF)-stimulated proliferation of endothelial cells, modulating the proliferation of proliferation of proliferation of endothelial cells, inducing proliferation of cells, modulating glucose or FFA uptake, inducing proliferation and/or rectinal neurons or rod photoreceptor cells, inducing proliferation and/or redifferentiation of chondrocytes. In particular, these are useful for detecting or treating cardiac insufficiency disorders, cancerous tumours, retinal disorders or injuries (e.g. loss of sight due to retinitis pigmentosum), obesity, diabetes, hyperinsulatingenia,

```
cutritis) in mammals. PRO polypeptides and their portions affect the arthritis) in mammals. PRO polypeptides and their portions affect the expression of genes which have a role in cell death. The polymucleotides care useful in molecular biology including uses as hybridisation probes for conseil in chromosome and gene mapping, in the generation probes conseil in chromosome and gene mapping, in the generation of antisense RNA and DNA, for preparing PRO polypeptides, for generating transgenic confinals or knockout animals which are useful in the development and screening of therapeutically useful reagents, as probes and for the genetic analysis of individuals with genetic disorders as well as for recombinantly expressing the protein and for chromosome identification. The proteins are useful as molecular marker for protein electrophoreats purposes, as therapeutic agents, for screening compounds to identify the proteins are useful as molecular marker for protein electrophoreats to be seful for tissue typing. PRO antibodies are useful for tissue typing. PRO antibodies are useful for continual and/or assay of sample fluids. Anti-PRO antibodies are useful in diagnostic assays for PRO e.g. detecting its expression in specific cells, tissues or serum and for affinity continuals in gene therapy, particularly for replacing a defective gene. The sequence presented is a PCR primer which was used to maplify a PRO polymucleotide of the invention.
   hypoinsulinaemia, or bone or cartilage disorders (e.g. sports injuries or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               8-0CT-
The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise and the nucleic acid encoding them. The PRO polypeptide for linking a bioactive molecule to a cell expressing a PRO polypeptide. For inking a bioactive molecule to a cell expressing a PRO polypeptide. The PRO polypeptide are useful for industry of a cell. PRO polypeptide are useful for modulating the biological activity of a cell. PRO polypeptide are useful for modulating the biological activity of conference of a cell expressing PRO pelypeptides. The PRO polypeptides are useful for stimulating the biological activity of a cell. PRO polypeptide on the properties are useful for stimulating the proliferation of polymorphy of neonatal provant factor (VEGP) stimulated proliferation of endochtalial cells, modulating the proliferation of retinulated proliferation of chondrocytes, chandring the survival or proliferation of chondrocytes, chandring the survival or proliferation and/or recills, modulating glucose or PRA uptake, inducing proliferation and/or recills, modulating glucose or PRA uptake, inducing proliferation and/or recills, modulating glucose or PRA uptake, inducing proliferation and/or recills, modulating or road photoreceptor cells, modulating modulating strangers or propression or propression of genes which beet with greates, hyperinalinaemia, cancerous cells, modulating glucose or PRA uptake, inducing proliferation and/or recills, modulating or bone or cartilage disorders (e.g. pports induced to the century or bone or cartilage disorders (e.g. pports induced to the century or bone or cartilage disorders (e.g. pports induced to the propression of genes which have useful in molecular biology including uses as hybridisation probes are useful in molecular marker for procein electrophores or purposes, as therapeutic agents of procein and plan with are useful in disorders are useful in disorders are useful as molecular marker for procein and propression in specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
